

TEI P5 Customization and Encoding Guidelines for Manuscript Description

These guidelines represent a community effort to develop uniform good practice in the cataloguing manuscripts using TEI. They are currently used by cataloguers at a number of institutions including the British Library, the Bodleian Libraries, Cambridge University Library, the John Rylands Library, and the Wellcome Trust. They remain under development and contributions are welcome via pull requests or issues submitted to the [GitHub repository](#).

Encoding guidelines

Introduction

TEI P5 ODD Customization for *Manuscripts in Oxford Libraries and the Fihrist and Senmai union catalogues*

Acknowledgements

These draft guidelines are currently based on two main sources - the encoding guidelines for the Fihrist project [[pdf](#)], and encoding guidelines for medieval manuscripts jointly created by Cambridge University Library (James Freeman, with Suzanne Paul) and the Bodleian Library (Matthew Holford) with contributions by Andrew Dunning (formerly British Library). The medieval guidelines in turn draw in places on the guidelines created by Patrick Granholm and Eva Nyström for [manuscripta.se](#).

General principles

Foreign Phrases and Words

Phrases or words in other languages than English may be tagged by adding the `@xml:lang` attribute to the element enclosing the text, or where no other element is available with a `<foreign>` element and a `@xml:lang` attribute. By default this text displays in italic when rendered in the online catalogue.

References to Locations within a Manuscript

References to a specific location or range within a manuscript should be given in a `<locus>` element. The `@from` and `@to` attributes are optional but recommended, as they enable links to images to be generated and allow calculation of the length of manuscript items.

If *@from* and *@to* attributes are used to refer to a specific folio or page they should be used with identical values. The foliation scheme should be specified in the *@scheme* attribute with the value folios or pages (the default is assumed to be folios. Lines and/or columns may be specified, e.g. fol. 1r, col. a, line 10 to fol. 2v, column b, line 5).

If reference to columns of text is necessary, use lower-case letters: a, b, c, etc. The lettering should begin with the first column on the left, and move across to the right. The sequence should begin afresh on each page (i.e. the letters do not run concurrently from recto to verso, or across an opening).

To identify columns / lines in the *@from* or *@to* attributes, use (for example):

```
<locus from="1ra10" to="2vb5">(fol. 1ra, line 10 - 2vb, line  
5)</locus>
```

Text in margins:

```
<locus from="1r" to="10r">(fol. 1r-10r, margins)</locus>
```

For texts scattered over more than one location in the manuscript the *<locusGrp>* element should be used.

```
<locusGrp>  
<locus from="356rb" to="356vb">Fols 356<hi rend="superscript">rb-vb</hi>,</locus>  
<locus from="374ra" to="374rb">374<hi rend="superscript">rab</hi>  
</locus>  
</locusGrp>
```

Personal Names

Persons, if not in an *<author>* or *<editor>* element, should be tagged using the *<persName>* element. For indexing to function correctly this MUST be linked to the persons authority file using the *@key* attribute. The role of the person referred to should be indicated using the *@role* attribute. Values should correspond to the Library of Congress relator term list (<http://www.loc.gov/marc//relators/relaterm.html>). The most commonly occurring roles are: "aut" (author), "bnd" (binder), "scr" (scribe), "art" (artist; NB this is preferred to illustrator), "fmo" (former owner), "sgn" (signer), "pat" (patron). If necessary, multiple roles can be separated with whitespace.

```
Common-place book of  
<persName key="person_697" role="scr fmo">John  
Curteys</persName> of Winchester College and New College, Oxford
```

To record alternative names for a person in such contexts, use nested *<persName>* elements, for example:

```

<persName key="person_f6124" role="scr">
  <persName xml:lang="fa-Latn-x-lc">'Abd al-Rahmān</persName>
  (<persName xml:lang="fa">عبد الرحمن</persName>)

</persName>

```

Use "fmo" where there is evidence that a person owned an item. Use "sgn" where the person is only associated with the item by a signature or an inscription which does not necessarily imply ownership. "dnr" (donor) may be used where the person gave the manuscript to an institution but evidence of ownership before the gift is lacking; i.e. to describe manuscripts apparently bought or made with the intention of being directly presented, or manuscripts may have been purchased with money given by a donor rather than directly presented.

Corporate / Organization Names

Corporate entities should be tagged using the `<orgName>` element. For indexing to function correctly this MUST be linked to the persons authority file using the `@key` attribute. The role of the organization referred to should be indicated using the `@role` attribute. Values should correspond to the Library of Congress relator term list (<http://www.loc.gov/marc//relators/relaterm.html>). Separate multiple roles with whitespace.

```

<orgName key="org_148998848" role="fmo">Würzburg, Domstift St Kilian</orgName>,
12th-century ex libris, fol. 1r, and 15th-century shelfmark, fol.
2r.

```

Placenames

In sections relating to manuscript contents, physical description and provenance, placenames should be tagged using the `<placeName>`. For indexing to function correctly this MUST be linked to the places authority file using the `@key` attribute.

```

<placeName key="place_1234">Bologna</placeName>

```

1 `<placeName>` (place name) contains an absolute or relative place name.

<code>@key</code> [att.canonical]	provides an externally-defined means of identifying the entity (or entities) being named, using a coded value of some kind.
--------------------------------------	---

In the `<origPlace>` element, placenames should be tagged using (as appropriate) `<country>`, `<region>` and `<settlement>`. Again, for indexing to function correctly these MUST be linked to the places authority file using the `@key` attribute. See under 0.

To accommodate geodata in legacy data, or for use by other systems, `<geo>` elements are permitted. But they are not displayed in catalogue web sites. For example, from the International Dunhuang Project:

```
<origPlace>DHMG.(Dunhuang Mogao) DHMG.17. <geo n="min">94.8038888888889198  
40.036388888888658</geo>  
<geo n="max">95.9375 40.048333333333201</geo>  
</origPlace>
```

In other cataloguing projects geodata should be given in the places authority file.

Hyperlinks

Hyperlinks may be created using the `<ref>` element with the URL as the value of the `@target` attribute. This can be used to provide links to relevant electronic resources.

```
<ref target="http://www.dimev.net/record.php?recID=4633">DIMEV  
4633</ref>
```

Formatting

In general, where possible, formatting should be carried out using semantic markup rather than using the `<hi>` element.

However, where use of the `<hi>` element is unavoidable, it should be used with the following values on `@rend`:

- superscript
- subscript
- underline

Multiple values may be separated by whitespace.

If correct formatting is not possible using these values, raise an issue on GitHub to add further values.

Attribute values

Attribute values forming more than one word in natural language should be given in camelCase.

Transcription

Transcriptions from the manuscript in the `<rubric>`, `<incipit>`, `<explicit>`, etc. elements, or in the provenance section, should be made diplomatically. Expand standard abbreviations silently. If the abbreviation can be expanded with some but not complete confidence, enclose the expansion in the `<ex>` element. Denote uncertain or ambiguous abbreviations with the character ' [U0146], e.g. Westm'

Use capital letters only when they appear in the manuscript.

Transcription of special characters: e-caudata should be transcribed using U+0119: Latin Small Letter E With Ogonek

The relevant elements from the TEI transcription module should be used (see especially 11.3.3.2, <http://www.tei-c.org/release/doc/tei-p5-doc/en/html/PH.html#PHCOMB>)

For retroconversion, reproduce the text as given in the printed catalogue. Where abbreviation is indicated typographically, e.g. with italic font or between parentheses, indicate this using the `<ex>` element. Typographic indications of insertion, deletion, omission, supplied text, etc., using symbols such as [], \V, should be replaced with the relevant elements from the TEI transcription module.

Manuscript punctuation may be simplified by replacing the punctus versus and punctus elevatus with a point (.).

Indicate damage using the `<damage>` element.

Errors in the manuscript may be indicated using the `<sic>` and `<corr>` and `<choice>` elements. `<sic>` by itself simply signals the presence of an error, `<corr>` provides the correction.

```
<!-- MS. Add. C. 145 --> Explicit <sic>loica</sic> magistri pauli de  
Venetijs  
  
<!-- MS. Add. C. 145 --> Explicit  
<choice>  
<sic>loica</sic>  
<corr>logica</corr>  
</choice>  
magistri pauli de Venetijs
```

The `<supplied>` element should be used for editorial additions, with the `@reason` attribute (sample values: omitted, illegible, damage, or unknown).

- 2 `<supplied>` (supplied) signifies text supplied by the transcriber or editor for any reason; for example because the original cannot be read due to physical damage, or because of an obvious omission by the author or scribe.

<code>@reason</code>	one or more words indicating why the text has had to be supplied, e.g. <i>overbinding</i> , <i>faded-ink</i> , <i>lost-folio</i> , <i>omitted-in-original</i> .
----------------------	---

- 3 `<ex>` (editorial expansion) contains a sequence of letters added by an editor or transcriber when expanding an abbreviation.
- 4 `<sic>` (Latin for thus or so) contains text reproduced although apparently incorrect or inaccurate.

Deletions by the scribe or later annotators should be recorded using the element. The @rend attribute may be used to indicate the manner of erasure: suggested values include strikethrough (the text has a line through it), erasure (the text has been scraped off), expunction.

- 5 (deletion) contains a letter, word, or passage deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, or a previous annotator or corrector.

@rend [att.global.rendition]	(rendition) indicates how the element in question was rendered or presented in the source text.
---------------------------------	---

Additions by the scribe or later annotators should be recorded using the <add> element, with the @place attribute. The values of the place attribute should be one of the values specified in the [EpiDoc guidelines](#), e.g:

- above: written above the line
- below: written below the line
- top: written in the top margin
- bottom: written in the bottom margin
- margin: written in an unspecified margin
- unspecified: written in an unspecified location

- 6 <add> (addition) contains letters, words, or phrases inserted in the source text by an author, scribe, or a previous annotator or corrector.

@place [att.placement]	specifies where this item is placed.
------------------------	--------------------------------------

Corrections by the scribe or later annotators should be recorded using a combination of the <add> and elements with the <subst> or <mod> element.

```
<incipit>Theodocius dicit De coniugationibus apud grecos iii sunt  
coniugationes uerborum  
qu<subst>  
<del>a</del>  
<add>o</add>  
</subst>rum prima  
positione</incipit>
```

Gaps should be marked with <gap> element, using the @reason attribute to described the nature of the gap, and the @unit attribute, in combination with @quantity, and if necessary @precision, to specify its extent. This extent should be indicated in characters if possible with the value char on the @unit attribute. The @atMost, @atLeast may be used instead of @quantity but these will be rendered as an ellipsis rather than a specific number of dots.

Suggested values for @reason

- damage: text has been omitted due to damage to the manuscript
- illegible: text has been omitted because it is illegible (but the manuscript is not otherwise damaged)
- editorial: text (e.g. the formulaic ending of an explicit) has been omitted for brevity
- space: the gap in the transcription represents space that has been left in the manuscript itself, usually with the intention of text being supplied at a later stage. (Note: do not use this to transcribe initial letters which have been omitted: these should be transcribed using the <supplied> element.)
- lacuna: there is no gap in the text being transcribed, but the text is not complete (e.g. words or lines have been omitted from an exemplar).

```
<gap quantity="5" reason="damage"
      unit="char"/>

<gap atLeast="4" atMost="6"
      reason="illegible" unit="char"/>
```

Questionable or partly legible readings should be marked with <unclear> (generates a '(?)' after the text in html)

Line beginnings should be indicated with empty <lb> elements, column beginnings with empty <cb> elements

Quotations from the manuscript

Quotations from the manuscript, outside of elements such as <incipit>, <explicit> and so on, should be enclosed in the <q> element. This may have attribute @type with sample values:

- pressmark: the quotation is a pressmark, shelfmark or similar
- exLibris: the quotation is an ex libris inscription
- inscription: the quotation is the inscription of a signer or reader

References to other manuscripts

References in the description to other manuscripts should be enclosed in <bibl> tags with @type of value MS. The @subtype may be used to indicate if the manuscript is held by the same institution that holds the manuscript being catalogued (value internal) or by another institution (value external). In the former case, the shelfmark should not include the location or institution name; in the latter case, location and institution should be included.

The <ref> element may be used to provide a link to an online catalogue or digital fascimile.

Eberbach, Cistercian abbey
(?): 'modern' chapter numbers added in boxes in the margin, as in
<bibl subtype="internal" type="MS">MS. Laud Lat. 107</bibl>.

This scribe was also responsible for most of the Simeon manuscript (<bibl subtype="external" type="MS">
<ref target="http://www.bl.uk/manuscripts/FullDisplay.aspx?ref=Add_MS_22283">London, British Library, Add. MS.
22283</ref>
</bibl>) but has not yet been identified in any other manuscripts or documents.

The TEI Header

The TEI root element must always contain a declaration of the TEI namespace, and an *@xml:id* with the manuscripts unique identifier in the form `manuscript_1234`.

The TEI element must have a `<teiHeader>` element and a `<facsimile>` element, and may have a `<text>` element. The `<teiHeader>` element in turn must have an *@xml:lang* attribute defining the language of the description, and a `<fileDesc>` and `<revisionDesc>` element. The `<TEI>` element itself MUST have an *@xml:id* attribute whose value is the unique identifier for the manuscript.

```
<TEI xml:id="manuscript_110" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader xml:lang="en">
    <fileDesc>
      <titleStmt>
        <!-- Title information --&gt;
      &lt;/titleStmt&gt;
      &lt;publicationStmt&gt;
        <!-- Information about the publication --&gt;
      &lt;/publicationStmt&gt;
      &lt;sourceDesc&gt;
        <!-- The MS description --&gt;
      &lt;/sourceDesc&gt;
      &lt;fileDesc&gt;
        &lt;revisionDesc&gt;
          <!-- Revision history --&gt;
        &lt;/revisionDesc&gt;
      &lt;/fileDesc&gt;
    &lt;/teiHeader&gt;
    &lt;text&gt;
      <!-- Optional text --&gt;
    &lt;/text&gt;
    &lt;facsimile&gt;
      <!-- Image information --&gt;
    &lt;/facsimile&gt;
  &lt;/TEI&gt;</pre>
```

File Description

The <fileDesc> element contains a <titleStmt>, <publicationStmt>, and <sourceDesc> element.

Title Statement

The <titleStmt> element summarizes the scope and authorship of the TEI file, and the cataloguing project of which it is a part, rather than for the manuscript itself (which is described in the <sourceDesc>). It must contain (1) a <title> element containing the manuscript shelfmark, (2) [for the medieval catalogue] a <title> element with @type attribute of value collection describing the collection of which the manuscript is a part, and (3) one or more <respStmt> elements listing the person(s) responsible for the cataloguing and encoding. The <respStmt> element must have a @xml:id attribute containing an identifier for the person(s) responsible for the cataloguing and/or encoding. The name should be recorded in a persName element (see 0) and the role of the person responsible in <resp> elements. If known, the date should be given in the @when attribute of <resp>

```
<titleStmt>
<title>MS. Laud Misc. 108</title>
<title type="collection">MSS. Laud Misc. (Laud
miscellaneous)</title>
<respStmt xml:id="MLH">
<resp when="2018">Cataloguer</resp>
<resp when="2018">Encoding and markup</resp>
<persName>Matthew Holford</persName>
</respStmt>
</titleStmt>
```

The <titleStmt> is also the place to record any funding bodies which contributed to the cost of cataloguing. The <funder> element can contain a plain text statement or <orgName> elements. The websites of sponsors, and their logos, can be included. For example:

```
<funder>
<orgName>
<ref target="https://www.yee.org.tr/">Yunus Emre Institute</ref>
<graphic url="https://www.yee.org.tr/sites/default/files/kurumsal/yunus_emre_enstitusa_logo-01.png"/>
</orgName>
</funder>
```

Ideally the @url attribute of the <graphic> element should point to an image hosted by the funding organization. The <graphic> element cannot be a child of the <funder> element, but must be enclosed in a <persName> or <orgName> element.

Contributions to the cost of purchasing the manuscript should be recorded as part of the 0 section of its history.

Responsibility

Where a description has been compiled from multiple sources, each source should be listed in the <respStmt>, and the elements of the description for which they are responsible should be identified using the @resp attribute with value equivalent to that source's @xml:id.

```
<respStmt xml:id="PA">
<resp when="1973">Cataloguer</resp>
<persName>Otto Pächt</persName>
<persName>J. J. G. Alexander</persName>
</respStmt>
<respStmt xml:id="MH">
<resp when="2017">Encoding and markup</resp>
<persName>Matthew Holford</persName>
</respStmt>
<respStmt xml:id="SC">
<resp when="1897">Cataloguer</resp>
<persName>Falconer Madan</persName>
</respStmt>
<respStmt xml:id="DL">
<resp when="1984">Cataloguer</resp>
<persName>A. de la Mare</persName>
</respStmt>
<respStmt xml:id="DD">
<resp when="1984">Cataloguer</resp>
<persName>A. G. Watson</persName>
</respStmt>

<provenance resp="#DL">
<persName key="person_2854" role="fmo">William Wilson</persName>, F.S.A., of the Minories, his
sale, Christie's, 31 Jan.-1 Feb. 1833, lot 56 on 1 Feb.:
bought by Thorpe for £53. 11s.
</provenance>
<provenance resp="#DL">Purchased from Thorpe by
<persName key="person_69848690" role="fmo">Douce</persName>, Feb.
1833.</provenance>
```

Publication Statement

The <publicationStmt> summarizes the publication of the TEI document, rather than the manuscript itself (which is described in the <sourceDesc>). For union catalogues such as Fihrist, it should contain an <email> containing the address to which enquiries should be sent, and an <idno> of @typemarcOrg containing the MARC Organization Code of the institution (e.g. "UkCu" for University of Cambridge).

```
<publicationStmt>
<publisher>Special Collections, Bodleian
Libraries</publisher>
```

```

<address>
<orgName type="department">Special Collections</orgName>
<orgName type="unit">Bodleian Libraries</orgName>
<orgName type="institution">University of
    Oxford</orgName>
<street>Weston Library, Broad Street</street>
<settlement key="place_7011931">Oxford</settlement>
<postCode>OX1 3BG</postCode>
<country>United Kingdom</country>
</address>
<distributor>
<email>specialcollections.enquiries@bodleian.ox.ac.uk</email>
</distributor>
<!--Availability statement will be added here-->
<idno type="msID">MS_Laud_Misc_108</idno>
<idno type="collection">Laud Misc</idno>
<idno type="catalogue">Western</idno>
</publicationStmt>
<!-- TODO: availability statement -->

```

Revision Description

The `<revisionDesc>` element records ONLY major changes to the catalogue entry, such as re-dating or re-location, addition of provenance information, new identification of contents, etc. It must contain at least one change element, which must have the `@when` attribute and may have the `@who` attribute (which may be linked to the `xml:id` of the person in the `<respStmt>` element in 0). The changes should be recorded in a reverse chronological order with the most recent change first.

```

<revisionDesc>
<change when="2018-06-15" xml:id="MMM">
<persName>Mitch
    Fraas/Mapping Manuscript Migrations</persName>
    Provenance and acquisition information added using
    <ref target="https://github.com/littlegustv/oxfordupdates/blob/master/test_case_for_oxford_prov.rb">https://github.com
    /littlegustv/oxfordupdates/blob/master/test_case_for_oxford_prov.rb</ref>
    in collaboration with the <ref target="http://mappingmanuscriptmigrations.org/">Mapping
    Manuscript Migrations</ref> project.'</change>
<change when="2017-07-01">First online publication.</change>
</revisionDesc>

```

Subject Classifications

In some catalogues, the fourth button in the header is "Subjects" rather than "Places". This is an index of subject classifications, using the Library of Congress subject heading and name authorities.

```

<encodingDesc>
<classDecl>
<taxonomy xml:id="LCSH">

```

```

<bibl>
<ref target="http://id.loc.gov/authorities/about.html#lcsh">Library of Congress Subject Headings</ref>
</bibl>
</taxonomy>
</classDecl>
</encodingDesc>
<profileDesc>
<textClass>
<keywords scheme="#LCSH">
<list>
<item>
<term key="subject_sh2008111606">Shafites--Early works
    to 1800</term>
</item>
<item>
<term key="subject_sh85072984">Koran--Recitation</term>
</item>
</list>
</keywords>
</textClass>
</profileDesc>

```

Keywords apply to the manuscript as a whole. You can associate each with one or more specific works by enclosing the `<term>` in a `<ref>` whose `@target` attribute is a space-separated list of pointers to the `@xml:id` values of `<msItem>` elements, prefixed with #.

Each `<term>` must have a key attribute containing the LoC authority entry identifier prefixed with "subject_". The text within the `<term>` element is also required, as this is what is displayed on the manuscript's page on the web site. It can be a variant of LoC's preferred term, if you think that more appropriate. If the term hasn't been used before, it will be automatically added to the web site the next time it is re-indexed.

Manuscript Description

The `<sourceDesc>` element contains a single child element, the `<msDesc>`. Within that is all the information about the manuscript as a physical object, its constituent parts, and intellectual works represented within.

All manuscript descriptions must be informed by attention to codicological units. In other words, whether the manuscript was created in one place, over one period of time, or is a composite of parts from multiple sources, assembled at a later date.

If the manuscript forms a single codicological unit, its intellectual content, physical description, and history should be described directly under the `<msDesc>` element. Individual works can vary in date or hands while still being of a single source. In such cases, add `<note>` elements to the `<msItem>` for each work, and an overview for the whole manuscript in `<physDesc>`, `<history>`, etc. Do not simply enter information (dates, dimensions, etc) as lists of `<ref>` elements.

If the manuscript comprises 0, each should be described in its own <msPart> element, and only information common to the whole manuscript should be described directly under the <msDesc> element. This will typically include aspects of the physical description (e.g. extent, foliation, binding), aspects of history (notably provenance and acquisition), but possibly also some intellectual content (for example, if a table of contents for the whole volume was added by a later owner, or if the manuscript has replacement leaves). Conversely information relevant to each unit should be described in separate <msPart> elements.

In each case the following elements are used:

```
<msDesc>
  <!-- Common information -->
  <msPart>
    <!-- Codicological unit 1 -->
  </msPart>
  <msPart>
    <!-- Codicological unit 2 -->
  </msPart>
</msDesc>
```

The Manuscript Identifier

Information about the current location and shelfmark of the manuscript should be given in the <msIdentifier> element using the following elements in the following order: <country>, <settlement>, <institution>, <repository>, and <idno> which must have @type with value shelfmark.

If the manuscript is well-known by another name this should be recorded in a <msName> element. Former shelfmarks may be given inside an <altIdentifier> element in an <idno> element (@type attribute with value former). If the manuscript has a reference number in another catalogue or reference work, this should be given inside an <altIdentifier> element in an <idno> element. The following values are currently used in the medieval catalogue:

- SCN - Summary catalogue number
- TM - identifier in Trismegistos
- PR - papyrological reference
- diktyon - Dikyon number

```
<msIdentifier>
  <country>United Kingdom</country>
  <region type="county">Oxfordshire</region>
  <settlement>Oxford</settlement>
  <institution>University of Oxford</institution>
  <repository>Bodleian Library</repository>
  <idno type="shelfmark">MS. Gr. class. b. 7 (P)</idno>
  <altIdentifier type="internal">
    <idno type="SCN">36946</idno>
  </altIdentifier>
```

```
<altIdentifier type="external">
<idno type="PR">P. Oxy. VII 1032</idno>
</altIdentifier>
<altIdentifier type="external">
<idno type="PR">P. Oxy. VII 1049</idno>
</altIdentifier>
<altIdentifier type="external">
<idno type="TM">20328</idno>
</altIdentifier>
<altIdentifier type="external">
<idno type="TM">28329</idno>
</altIdentifier>
</msIdentifier>
```

The Heading

For manuscripts described in detail, and/or containing more than one item, the `<head>` element should provide (1) a brief descriptive title (2) place of origin if known (3) date of origin. If the latter two are unknown, use the `<summary>` element within `<msContents>` instead.

```
<head>Ovid; England, 12th century</head>
```

Intellectual Content

The intellectual content of the manuscript or codicological unit should be listed in the `<msContents>` element.

Summary (optional)

The `<summary>` element can be used to provide a brief prose account of a manuscript's contents and significance, unless this has already been covered by the `<head>`.

Language(s) of the manuscript as a whole (optional)

Give the text language for the codicological unit in the `<textLang>` element , as a child of `<msContents>`, immediately after `<summary>` (if used), with the `@mainLang` attribute.

```
<textLang mainLang="grc">Greek</textLang>
```

For bilingual or multilingual units give the other languages in the `@otherLangs` attribute, as a space-separated list.

```
<textLang mainLang="grc"
otherLangs="la enm">Greek with some
Latin and Middle English</textLang>
```

In some cases the decision of which language is ‘main’ and which is/are ‘other’ may be rather arbitrary.

The attributes values used should conform to the BCP 47 standard (<http://www.rfc-editor.org/rfc/bcp/bcp47.txt>) which start with two-or-three-letter ISO 639 codes for languages, then an ISO 15924 code for the script, and finally IANA language subtags (<https://www.iana.org/assignments/language-subtag-registry/language-subtag-registry>) for other information, such as methods of transliteration.

If the unit contains multiple works, in different languages or scripts, the <textLang> element should be used in the <msItem> instead, q.v.

According to the conventions of the catalogue, languages may be encoded at a high or low level of granularity - for example, Middle English may be encoded as "enm" or as "en", Anglo-Norman French may be encoded as "fr" or "xno".

Current recommendations (July 2023) for cataloguers at Oxford and Cambridge are to encode languages to as granular a level as possible using the following codes:

Latin	la
Ancient Greek	grc
Modern Greek	el
Old English	ang

Guidance for other vernacular languages is under development.

Manuscript Item

The <msItem> element may be used:

- To describe an item of intellectual content (including blank leaves if necessary)
- To provide various notes about the manuscript's contents (e.g. to compare items and their order with the contents of other manuscripts, or to provide a note of content now missing that was formerly present.)

As a general rule, each distinct item in the manuscript should be described in a distinct <msItem> tag.

The items should be numbered with the @n attribute. (This is particularly useful when the <msItem> element is nested, say to describe sections within works, or works in collections of works.) For

retroconversion, follow the numbering system used in the original catalogue. For new cataloguing, use arabic numbers, using a decimal point when `<msItem>` is nested. For example, for the second section of the first work:

```
<msItem n="1.2">
<!-- ... -->
</msItem>
```

Just as the `@n` attribute provides a way for readers to reference and locate items, `@xml:id` attributes do the same for computers. So these ideally should be added too:

```
<msItem n="1.2"
  xml:id="Add_1056-item1-item2">
<!-- ... -->
</msItem>
```

Blank pages may be recorded as part of the item they follow, in a separate `<note>` element. The `<locus>` element may be used to encode the folio(s).

```
<note>
  <locus from="187v" to="187v">Fol. 187v</locus>
  blank.
</note>
```

More extensive stretches of blank pages can be placed in a separate `<msItem>`.

```
<msItem>
  <locus from="187v" to="189v">(fols. 187v-189v)</locus>
  <note>Blank.</note>
</msItem>
```

Pages containing short notes or scribbles by later hands should be recorded in the `<additions>` element, see 0.

What is a manuscript item?

The Guidelines offer the following definitions: ‘each discrete item in a manuscript’; ‘an individual work or item within the intellectual content of a manuscript’. Often the identification of these works or items does not pose difficulties, but many more complex cases do occur.

A more helpful definition of a manuscript item may be ‘a complete work or item, or a self-contained part of a larger work with (potentially) independent circulation’. A ‘self-contained part of a larger work’ could be a letter in a letter-collection, or a sermon in a homiliary; it could also represent the biblical text or the commentary in a glossed biblical manuscript.

As a guiding principle, where possible and practicable the <msItem> element should be used to markup up the work as a whole, and its self-contained parts, and the nesting of the different <msItem> elements should express the relationship between part and whole.

However, it is recognised that it may not be practical (for example) to markup every letter in a letter-collection as an <msItem>, and that the contents and order of a collection may simply be recorded in a <note> element.

```
<author key="person_95147024">Jerome</author>
<title key="work_2426">112 letters</title>
<note>
  <title>Epist.</title> 57 (38), 73 (44), 129 (57), 35
  (1), 36 (2; as 3 items, dividing in sects. 10-15), 62
  (3), 19 (4), 20 (5), 15 (6), 16 (7), 18B (8), 18A (9),
  21 (10), 14 (37), 52 (33), 58 (34), 55 (?), 83-4
  (39-40),
  <!-- etc. -->
</note>
```

Difficulties are posed by:

- texts which circulate with shorter related texts, for example Augustine's De Trinitate, preceded in Merton College MS. 32 by the relevant extract from Retractationes and by Ep. 74.
- texts followed or preceded by indexes (e.g. Merton College MS. 34, Augustine on the Psalms followed (fols. 385-412v) by a subject index).
- brief items not catalogued in detail or not considered worth cataloguing in full, e.g. Merton College MS. 13 art. 6, Proverbia Wiponis 'followed by brief theological notes'. Merton College MS. 13, art. 22, Prosper, Responsiones, 'Followed by 'Quot secte Iudeorum. Quot fuerunt secte Iudeorum qui fuerunt separati a communi uita ...', and extracts from Augustine, Jerome and Ambrose ff. 116v-17v.'

Recommended best practice is to catalogue and encode so that each item mentioned is discoverable. This can be achieved in different ways according to the information available.

Suggested encodings for the above examples are:

```
<msItem>
<author key="person_66806872">AUGUSTINE</author>
<title key="work_784">De Trinitate</title>
<note>Preceded by the relevant extract from <title key="work_804">Retract.</title> and the
<title key="work_801">Epistola ad Aurelium (Epist.
  74).</title>
</note>
</msItem>

<msItem>
<locus>(fols. 1-384v)</locus>
<author key="person_66806872">AUGUSTINE</author>
```

```

</msItem>
</msItem>

```

For sample encodings of liturgical books (a Book of Hours) and a Bible, see the Appendix.

Texts with gloss and commentary

Treatment of these texts will vary according to the arrangement of text, gloss, and commentary; whether gloss and commentary are continuous; whether gloss and commentary are contemporary or later, and whether they form an integral part of the mise-en-page; whether there are multiple layers of gloss / commentary. Examples:

```

<!-- MS. Junius 27 --><msItem>
<note>Psalter with Old English gloss</note>
<msItem>
<title>Psalms (Roman version)</title>
<note>Beginning imperfectly at 2.4 and ending at
144.6</note>
<incipit defective="true">Qui habitat in
caelis</incipit>
<explicit defective="true">terribiliorum tuorum
dicent</explicit>
</msItem>
<msItem>

```

```

<title type="desc">Continuous interlinear gloss in
Old English</title>
<incipit>se eardað in heofonum</incipit>
<explicit>þinra eyes fulnessa cweoðað</explicit>
</msItem>
</msItem>

<!-- Christ Church MS. 95 --&gt;&lt;msItem&gt;
&lt;locus&gt; Fols 1-161&lt;hi rend="superscript"&gt;v&lt;/hi&gt;
&lt;/locus&gt;
&lt;title key="work_13747" type="desc"&gt;Pauline Epistles,
with gloss &lt;/title&gt;
&lt;msItem&gt;
&lt;incipit type="text"&gt;Pavlvs seruus ihesu cristi
uocatus apostolus segregatus&lt;/incipit&gt;
&lt;/msItem&gt;
&lt;msItem&gt;
&lt;note&gt;Interlinear gloss:&lt;/note&gt;
&lt;incipit&gt;Saluatoris Regis sacerdotis cui merito
omnes serui predicandum&lt;/incipit&gt;
&lt;/msItem&gt;
&lt;msItem&gt;
&lt;note&gt;Marginal gloss:&lt;/note&gt;
&lt;incipit&gt;Pro altercatione scribit apostolus Romanis
confutans modo gentiles&lt;/incipit&gt;
&lt;/msItem&gt;
&lt!-- ... --&gt;
&lt;/msItem&gt;
</pre>

```

Relating manuscript items to quires

Some catalogues/cataloguers indicate the relationship between each item and the quires of the codex. This may be encoded as follows:

```

<msItem>
<note>Items 2-3 occupy quires 3-4.</note>
</msItem>

```

Extracts and parts of works

If only an extract of a work is present this should be encoded using the `<bibl>` element. Within this, the `<citedRange>` element may be used to provide a machine-reading encoding of which parts of the work are given.

```

<author key="person_59077661">Thomas à Kempis</author>
<title key="work_4859">Imitatio Christi</title>
<bibl>(book <citedRange from="1" to="1" unit="book">i</citedRange>)</bibl>

```

General notes on the content

These may be placed at the beginning or end of the <msContents> section in a separate <msItem> element.

```
<msItem>
<note>Items (a)-(i), (j), (k) are in Vienna,
    Nationalbibl. MS. 415 in the same order.</note>
</msItem>
```

Added texts

Significant added texts should be described in <msContents>, NOT in <additions>. Decision as to what is 'significant' will be a matter of judgement, but in general if the text is to be discoverable - if it is important for the text to be identified or described, or to have its rubrics / incipits recorded, etc. - it should be encoded using <msItem>. This may involve some reorganization of the description during retroconversion.

Two possible approaches are described here. Each may be appropriate in different circumstances, dependent for example on the nature of the manuscript and/or the nature of the description being converted:

- describe every <msItem> in sequence, using <note> to indicate if it is a later addition
- Group added texts together in a separate section at the end of <msContents>, preceded by

```
<msItem>
<note>Added texts:</note>
<!-- added texts here -->
</msItem>

(epistle, lesson, gospel) for Sundays and
feastdays; in gothic textura quadrata, s.
xiii/xiv.</note>

```
</msItem>  
</msItem>
```

Locus

Give the start and end folio of each item according to the guidelines specified in 0. If there are several items on a single folio, you may specify on which line the text starts and ends. For texts scattered over more than one location in the manuscript the `<locusGrp>` element should be used.

```
<locusGrp>  
  <locus from="356rb" to="356vb">Fols 356<hi rend="superscript">rb-vb</hi></locus>  
  <locus from="374ra" to="374rb">374<hi rend="superscript">rab</hi>  
  </locus>  
</locusGrp>
```

Author

The author of a manuscript item, if known, should be recorded inside the `<author>` element. This MUST have a reference, using the `@key` attribute, to the persons authority file, see 0. The `<author>` element should be omitted for anonymous works.

```
<author key="person_66806872">Augustine</author>
```

The author name should be given in a standardized form. For retroconversion, use the form of the name given in the source text; for new cataloguing, use a standard form from the usual reference works.

If you are not responsible for maintaining the authority files, go to the web site, click the People button, and search to see if the same person already exists in another manuscript in the same catalogue, with the same or similar (or translated) name. If they have, set the `@key` attribute to the identifier of the existing record, which is the part of the URL after the last slash, starting with "person_". If you can find the person by searching in VIAF (<http://viaf.org/>) set the value to "person_" followed by their VIAF number. Otherwise, leave the `@key` attribute blank and an identifier will be assigned to it at a later date.

Where an author has multiple names (e.g. translations or transliterations) add these as child `<persName>` elements (with `@xml:lang` attributes). Do not use `<foreign>` in this context. But the `@key` attribute remains on the `<author>` element. Multiple `<author>` elements should be used for works with multiple authors (not other contributors, such as scribes, these should be added as `<editor>` elements with `@role` attributes.)

(Optional) Either `<author>` or `<persName>` elements can contain `<surname>`, `<forename>` and `<addName>` child elements to divide up the full name as appropriate to naming customs (`<addName>` has a `@type` attribute in which you can specify "laqab", "kunyah", "khatab", "nisbah", etc.)

(Optional) To indicate that an author's name is not present in the MS., use <supplied>.

```
<author key="person_66806872">
<supplied>Augustine</supplied>
</author>
```

Pseudonymous, multiple, uncertain, disputed and attributed authorship

Texts which circulated consistently but incorrectly under the name of an author, but whose true author is not known, are by convention attributed to Pseudo-Augustine, Pseudo-Ambrose, etc., and these conventional attributions should be followed.

```
<author key="person_7386286">Ps.-Augustine</author>
<title key="work_3881">De Vera et Falsa
Poenitentia</title>
```

Texts which circulated consistently but incorrectly under the name of an author, but whose true author IS now known or suspected, should be catalogued under the author which modern scholarship prefers. In some cases, where the association with other authors is strong, it will be useful to give these in addition.

```
<author key="person_79148266">Haimo of Auxerre
(Ps.-Haimo of Halberstadt, Ps.-Cassiodorus)</author>
<title key="work_1946">Commentary on the Song of
Songs</title>
```

Note that the pseudonymous authors do not have their own <author> element (these may be given in the authority file: q.v.).

Where the attribution of a text in the manuscript differs from the attribution of modern scholarship, this can be recorded either in a <note> element or by relevant markup in the <rubric> element. Use the <persName> element with attribute @role of value att (= 'attributed name')

```
<author key="person_84971682">Ivo of Chartres</author>
<title>Epistola ad Seuerinum</title>
<rubric>Incipit liber <persName key="person_100187025"
role="att">Anselmi</persName> de caritate</rubric>

<author key="person_209749583">
<supplied>Ps.-Bede</supplied>
</author>
<title key="work_6131">
<supplied>Commentary on
John</supplied>
</title>
<note>Cap. 3. Here ascribed to <persName key="person_66806872" role="att">Augustine</persName>. </note>
```

Multiple authors can be indicated using repeated `<author>` elements.

```
<msItem n="1" xml:id="MS_Douce_332-item1">
<author key="person_95220054">Guillaume de
Lorris</author>
<author key="person_304922354">Jean de
Meung</author>
<title key="work_1919">Le Roman de la Rose</title>
<textLang mainLang="frm">Middle French</textLang>
</msItem>
```

Uncertainty regarding authorship can be indicated using the `@cert` attribute. Following the usage of Richard Sharpe, ‘attrib.’ can be used for modern scholarly attributions of authorship; ‘ascr.’ denotes ascriptions in manuscripts; and ‘(?)’ denotes broader uncertainty.

```
<author cert="medium" key="person_2205">Roger of Caen
(attrib.) (Ps.-Alexander Nequam)</author>
<title key="work_4455">De professione monachorum</title>
```

Editor / translator / etc.

For secondary statements of responsibility, use the `<editor>` element, distinguished with a `@role` attribute containing a three-letter code (or multiple codes separated by spaces) selected from the MARC relators list (<https://www.loc.gov/marc/relators/relaterm.html>). Do not add a label for their role, as this will be added when displayed on the web site. For example, for a translator:

```
<editor key="person_5150639" role="trl">
<persName>Abū al-Fazl ibn Mubārak, 1551-1602</persName>
<persName xml:lang="fa">ابو الفضل بن مبارك علامي</persName>
</editor>
```

In all other respects, `<editor>` elements can contain the same child elements as `<author>` (eg. multiple `<persName>` elements) and attributes (e.g. a `@key` linking them to an entry in the persons authority file, so that they are indexed on the web site.) Further details about their role in the creation of the work can be explained in a separate `<note>`.

Alternatively (this is current practice in the medieval catalogue) information about translators, etc., may be provided in the `<note>` element as follows:

```
<author key="person_95155322"> Origen </author>
<title key="work_3395">Homilies on Joshua</title>
<note>(Latin tr. by <persName key="person_77679446" role="trl">Rufinus</persName>)</note>
```

Title

The title element provides a standarized uniform title or a descriptive title for a manuscript item.

For retroconversion, use the form of the title given in the source catalogue (if one is given); for new cataloguing (or if the converted catalogue does not supply a title), use a standard form from the usual reference works; if a standard form cannot be found, one should be supplied by the cataloguer. By default titles are displayed in italic font.

If the title is descriptive, the `@type` attribute should then be set with the value desc. This will display the title in normal font. Alternative titles should be give a `@type` of alt, and main and sub can be used if there is a subtitle.

When providing translations of the title, or multiple versions in different scripts or forms of transliteration, add them as sibling `<title>` elements, each with an `@xml:lang` attribute. Do not use `<foreign>` except to mark up a word or phrase within a title as being in a different language to the rest of the title.

Works which are to be indexed (i.e. you consider significant enough to be listed under the Works button on the web site) MUST have a reference using the `@key` attribute to the works authority file

```
<title key="work_15602" type="desc">Commentary on  
Apocalypse</title>
```

If you are not responsible for maintaining the authority files, go to the web site, click the Works button, and search to see if the same work already exists in another manuscript in the same catalogue, with the same or similar (or translated) title. If it has, set the `@key` attribute in the `<title>` element(s) to the identifier of the existing record, which is the part of the URL after the last slash, starting with "work_". Otherwise, leave the key attribute blank and an identifier will be assigned to it at a later date.

(optional) to indicate the title is not given in the manuscript, use the `<supplied>` element.

```
<author key="person_89657091">  
  <supplied>Bonaventure</supplied>  
</author>  
<title key="work_1144">  
  <supplied>Legenda  
    maior</supplied>  
</title>
```

Rubrics, incipits, explicits, final rubrics, and colophons.

Retroconversion: include these items if they are given. New cataloguing: include these items for all texts. The absence of a rubric need not be noted, although it can be included in a `<note>` if it is significant (e.g. all other texts do have rubrics).

Follow the principles of transcription outlined above 0 to transcribe the MS. or to encode the text given in an existing catalogue.

It is assumed that the language of incipits, etc., is the same as the language specified in <textLang>. It is not necessary to use @xml:lang to specify the language of the incipit (etc.), unless multiple languages are involved (e.g. <msItem> with <rubric> in French but <incipit> in Latin).

```
<msItem xml:id="MS_Buchanan_e_13-item1-item5-item1">
<locus>(fols.18r-21v)</locus>
<rubric xml:lang="frm">Oraison tres deuote de nostre
dame</rubric>
<incipit xml:lang="la">Obsecro te</incipit>
<note>[masculine forms] (cf. MS. Buchanan e. 2)</note>
</msItem>
```

For mutilated items the attribute @defective should be used with value true.

The formatting of the rubric can be recorded in the @rend attribute (see 0). Comments on the rubric (e.g. if it is a later addition) can be recorded using a <note> tag inside the <rubric> tag.

```
<msItem n="6" xml:id="MS_Ashmole_304-item6">
<locus from="64r" to="70v">(fols. 64r-70v)</locus>
<title key="work_16047">Divinacio
ciceronalis</title>
<note>(incomplete)</note>
<note>See A. A. Guardo, 'La <foreign rend="italic">Divinacio Ciceronalis</foreign>: un libro de
suetos medieval. Estudio introductorio', in
<title>De lo humano y lo divino en la literatura
medieval: santos, ángeles y demonios</title>, ed.
Juan Paredes Núñez (2012), 17-34.</note>
<note>The surviving section in this MS. comprises the
responses, fourteen (of originally 20) sections of
21 lines, the first line of each in red, each
section attributed to sun, moon, a planet or a sign
of the zodiac (Guardo's section 4). The text in MS.
Digby 46 has in addition a miniature of Cicero,
twenty prognostical questions, and directions for
use (see Guardo).</note>
<rubric>Sol iudex primus</rubric>
<incipit defective="true">
<note>(first line in
red)</note> Mittam te ad amicum meum et dicet tibi
uerum Certe tibi dico prope est ut gaudeas et mutes
fortunam</incipit>
</msItem>
```

Note that TEI distinguishes between the <finalRubric>, which contains a statement relating to the end of a particular work (e.g. 'explicit liber'), and the <colophon>, which contains a statement about the scribe and/or date and/or place of writing ('scriptum apud Oxon.'). If the final rubric and colophon form a single sentence, put both inside <finalRubric> with @type attribute of value colophon. (The <colophon> element cannot have the @type attribute.)

```
<finalRubric type="colophon">Expliciunt omelie Iohannis  
Crisostomi patriarche Constantinopolitanis super Matheum  
operis imperfecti scripte anno Domini 1382</finalRubric>
```

Multiple incipits, rubrics, etc., e.g. for prologues, dedications, text, should be distinguished using @type (and if necessary by location, by including a child <locus> element at the start of each one). Suggested values of the @type attribute are prologue (use for preface, prohemium, etc), dedication, text

```
<msItem>  
<locus from="12v" to="12v">(fol. 12v)</locus>  
<author key="person_11566602">Garland</author>  
<title key="work_1724" type="desc">Compotus</title>  
<incipit type="prologue">Sepe uolumina domni  
Bede</incipit>  
<incipit type="text">Superioris igitur pagine</incipit>  
</msItem>
```

Use of the @type attribute will not always be possible in retroversion if the catalogue does not provide the information. In this case a series of the relevant elements without @type should be used.

```
<!-- Merton College MS. 20 --><msItem n="1">  
<locus from="1r" to="14v">(fol. 1-14v)</locus>  
<author key="person_100187025">Anselm</author>  
<title key="work_537">Monologion</title>  
<rubric>Incipit epistola Anselmi archiepiscopi ad  
Lanfrancum primatem Anglie</rubric>  
<incipit>Reuerendo et amando suo domino</incipit>  
<rubric>Incipit prohemium beati Anselmi archiepiscopi in  
monologion R.</rubric>

Explicit.</finalRubric>  
<bibl>  
<title>SAO</title> 1. 13-87.</bibl>  
</msItem>
```

The <rubric>, <incipit>, etc. elements should not have final punctuation, unless they contain more than one sentence, in which case there should be a closing period.

Complex incipits

The `<incipit>` elements in a catalogue may be processed to generate an alphabetical list of incipits similar to those in a print catalogue.

For long and complex incipits, care should be taken to mark up the content in a way that enables multiple index entries to be generated to aid discovery.

Incipits containing an initial address should be divided into two `<incipit>` elements, the first containing the address and the second the incipit itself.

```
<author key="person_47155211">PETER OF WALTHAM</author>
<title key="work_3545">Remediarium Conuersorum</title>
<incipit>Reuerendo patri Ricardo ecclesie Londoniensi
episcopo tertio suus Petrus Blesensis archidiaconus
eiusdem ecclesie sic currere per temporalia ut
brauium apprehendat eternum</incipit>
<incipit>De beata mentis solitudine necnon et euangelice
paupertatis beatitudine </incipit>
```

Incipits of sermons often begin with a biblical lemma, and in a printed catalogue would be indexed both under the lemma and under the incipit. These should be marked up using the `<cit>`, `<quote>`, and `<bibl>` elements as follows.

```
<incipit>
<cit>
<quote rend="italic">Qui mihi ministrat me
sequitur.</quote>
<bibl>Io. 15.</bibl>
</cit> In his uerbis notantur
duo; primum est Christo debita
administracio
</incipit>
```

If the source is not given, the `<quote>` element only may be used.

```
<incipit>
<quote rend="italic">
<supplied>V</supplied>erbo
Domini celi firmati sunt</quote> &amp; c. Tria in
hiis uerbis sunt notari primum omnium sacre
scripture dignitas
</incipit>
```

Where a brief lemma would not typically be indexed separately (e.g. in a glossary or commentary), but would be considered an integral part of the incipit, the lemma may only be distinguished typographically.

```

<incipit>
<hi rend="italic">Abba</hi> secundum Papiam
Syrum nomen est
</incipit>

```

Note, bibliography and additional information

Additional information about the text - for example whether or not the text is complete; whether or not the text is glossed or annotated; other copies of the text; references to repertories and editions - can be presented in various ways. It may be convenient in retroconversion to include this information in a single `<note>` element. Equally some of this information may be encoded more appropriately using other elements, such as `<bibl>` or `<filiation>`. Compare:

```

<msItem n="3">
<locus>(fols 54r-73r)</locus>
<author key="person_196789494">
<supplied>Ps.</supplied>
Athanasios</author>
<title key="work_5884">Disputatio contra Arium</title>
<note>CPG 2250, PG 28.440-501.</note>
</msItem>

<msItem n="3">
<locus>(fols 54r-73r)</locus>
<author key="person_196789494">
<supplied>Ps.</supplied>
Athanasios</author>
<title key="work_5884">Disputatio contra Arium</title>
<listBibl>
<bibl>CPG 2250</bibl>
<bibl>PG 28, 440-501</bibl>
</listBibl>
</msItem>

```

The `<filiation>` element provides information about the relationship of the manuscript with other surviving manuscripts in terms of their content. For example:

```

<msItem n="2">
<title xml:lang="ara-Latn-x-lc">Khulāṣat al-ikhtīṣāṣ fī
ma‘rifat al-quwā wa-al-khawāṣṣ</title>
<filiation>There is another manuscript of this work at
the Birmingham University, Mingana Collection,
Islamic Arabic Ms. no. 933 (1485)</filiation>
</msItem>

```

A `<bibl>` containing a `<ref>` element can be used to link to external resources related to a work, such as printed catalogue pages.

```

<listBibl>
<bibl>
<ref target="http://www.lib.cam.ac.uk/arabic_catalogues/browne/view.php? id=76">no. 673</ref>
</bibl>
</listBibl>

```

Do not use this method to link to digitized copies, use 0 instead.

Physical description

The physical description includes several different aspects of the manuscript (or part of a manuscript) including:

- aspects of the form, support, extent, and quire structure of the manuscript object and of the way in which the text is laid out on the page.
- the style of writing used and discussion of any decorative features, any musical notation employed, and of any annotations or marginalia.
- discussion of binding, seals, and any accompanying material.

secundo folio

Provide a transcription of the words found at the beginning of the recto side of the second leaf of the manuscript. These were often used in medieval book-lists or inventories and may sometimes be useful for identification of provenance – or simply for modern-day identification.

This information is placed inside the <secFol> element, inside a <p> element, directly after <physDesc>

If the manuscript begins imperfectly – for instance, if the first leaf of text is missing – provide both the original and the present-day secundo folio, in order to avoid any ambiguity.

If the manuscript begins with prefatory paratextual matter, such as an index, you should record the secundo folio in both this and the main text. Use <locus> to record the location of each.

If the secundo folio begins mid-word, the missing portion may be provided inside a <supplied> element

```

<!-- MS. Buchanan e. 10 --><physDesc>
<p>
<secFol>
<locus from="3r" to="3r">(Calendar, fol. 3)</locus>
    KL Fleurier a</secFol>
<secFol>
<locus from="15r" to="15r">(text, fol. 15)</locus>
    venientem in</secFol>
</p>
</physDesc>

```

Object Description

The physical form of the carrier should be set in the *@form* attribute of the <objectDesc> element. This should refer to the form of the object in its original state, before any mutilation, rebinding etc. The following values are recommended:

- codex: multiple gatherings of leaves, held within a binding of some kind, and used by turning the leaves.
- roll: a parchment membrane, or two or more such membranes, either sewn together edge-to-edge to form a continuous surface for writing, or laid together in a pile and sewn together at the head, and used by unrolling the membranes.
- sheet: a single sheet of parchment or paper, not intended to form part of a codex, either kept flat or folded (rather than rolled) for storage.
- faltbuch
- roll-codex
- other
- unknown

The following may also be used:

- booklet: a gathering of two or more bifolia, with a binding/covering, that appears to be complete in terms of its original textual content
- quire: a complete gathering of two or more bifolia, without a binding/covering.

```
<physDesc>
  <objectDesc form="codex">
    <!-- -->
  </objectDesc>
</physDesc>
```

Support Description

The <supportDesc> element may contain the following elements:

- 7 <support> (support) contains a description of the materials etc. which make up the physical support for the written part of a manuscript or other object.
- 8 <extent> (extent) describes the approximate size of a text stored on some carrier medium or of some other object, digital or non-digital, specified in any convenient units.
- 9 <foliation> (foliation) describes the numbering system or systems used to count the leaves or pages in a codex or similar object.
- 10 <collation> (collation) contains a description of how the leaves, bifolia, or similar objects are physically arranged.
- 11 <condition> (condition) contains a description of the physical condition of the manuscript or object.

The support material for the codicological unit(s) should be recorded in the `@material` attribute of `<supportDesc>`. Allowed values are: chart (for all kinds of paper), perg (for parchment and vellum), papyrus, palm (palm leaf), mixed, unknown, or other. The name of the material for display purposes, and further description of the support, should be added in the `<support>` element. For example:

```
<supportDesc material="chart">
<support>Paper</support>
</supportDesc>

<supportDesc material="perg">
<support>Exceptionally thick, stiff parchment</support>
</supportDesc>
```

Support

Provides a prose description of the material. For parchment, this may include comment on the quality of the parchment and its disposition. For mixed material, the nature of the combination should be described.

```
<support>Paper,
with parchment bifolia for the outer and inner
leaves of the quire.</support>
```

If the disposition of hair and flesh sides of parchment is recorded, this should be done consistently using the letters H (for hair) and F (for flesh) inside a `<term>` element with attribute `@type` of value disposition. If the disposition is consistent throughout the manuscript, the formula need only refer to each side of the first two leaves in a quire. For example, HFFH indicates that the hair side is on the outside of the quire, with flesh sides facing flesh sides and hair sides facing hair sides in the rest of the quire (and vice versa). By contrast, FHFH indicates that the flesh side is on the outside of the quire, with hair sides facing flesh sides and flesh sides facing hair sides in the rest of the quire (and vice versa). For irregularly arranged quires, we recommend the provision of a full formula. If the disposition varies between portions of a composite manuscript, use `<msPart>` to provide separate formulae. Formulae such as 'HSOS' (hair side outside) should be altered in retroconversion. If the disposition of parchment varies between quires or otherwise between sections of the manuscript, it should be described in the `<layout>` element, rather than in `<support>`.

```
<support>Parchment (<term type="disposition">FHHF</term>)</support>
<support>Parchment (<term type="disposition">HFHF</term>)</support>
```

Note that this convention regarding H and F differs from the usage attributed to Julian Brown, in which our HFFH would be rendered HHHH, the H in the latter case describing the recto of each leaf in the first half of the quire. If retroconverting, ensure that you have understood the original intention of the cataloguer.

If different materials are used (paper and parchment, different kinds of parchment, or different paper stocks, for example), these may be described in separate `<material>` elements.

Description of paper

The level of detail in which paper is described will vary: in retroconversion, according to the detail of existing descriptions; in cataloguing afresh, according to the resources available

The paper should be described inside the `<support>` element. If there are multiple paper stocks, each should be described in its own `<material>` element.

The folding of the paper should be recorded using a `<measure>` element with the `@type` attribute (value: folding) and `@quantity` attribute whose values will be folio, quarto, etc.

The original size of the sheet may be given using `<dimensions>` with attribute `@type` of value `paperSheet`

The number of chainlines per leaf should be recorded using a `<measure>` element with `@type` of value `chainlinesLeaf` and an appropriate value of `@quantity`.

The distance between chainlines may be recorded using `<dimensions>` with `@type` of `chainLines`, containing a `<width>` element with `@quantity`.

1. Watermarks

Describe each watermark in the `<watermark>` element.

The key term for the motif should be encoded using the `<term>` element with attribute `@type` of value `watermarkMotif` and attribute `@key` with the relevant value from the IPH standard. Additional descriptive terms may be placed inside a `<note>` element with `@type` of `watermarkVariation`

The position of the watermark should be recorded in a `<note>` element with `@type` of `watermarkPosition`

The dimensions of the watermark may be given in a `<dimensions>` element with `@type` of `watermark`.

References to printed repertoires may be given in the format specified above at Repertoires. References to online repertoires may be given using the `<ref>` element.

Countermarks should be described using the `<countermark>` element. Note that this customization is not currently part of the TEI P5 standard.

2. Examples:

```
<watermark>
<term key="J3/3" type="watermarkMotif">Monts/Dreiberg</term>
</watermark>
```

```

<support>
<material>
<locus from="1r" to="48v">Fols. 1-48</locus>,
paper, folded in <measure>quarto</measure>; <num type="chainlinesLeaf">8</num> chainlines per leaf.
<watermark>Watermark: <term type="watermarkMotif">Hand</term>, <note type="variation">surmounted by
a fleuron</note>, <note type="position">on a
chainline</note>. </watermark>
</material>
</support>

<support>
<material>
<locus from="1r" to="48v">1-48</locus>, paper,

<height>41</height>
<width>19</width>
</dimensions>
</watermark>
</material>
</support>

```

Extent

This should contain:

- a description of the present state of the item (if different from <objectDesc>), using <objectType>
- the number of leaves, using <measure>
- measurements of the leaves, using <dimensions>

<seg> and @type may be used to separate these sections within extent, as shown below.

If the present state of the item is different from its original state, record this information within <objectType>, using the following terms:

- roll-codex = a codex in which formerly joined membranes have been separated and rebound to resemble a codex, perhaps in concertina form
- fragment = one or more remnants from a manuscript, whose survival in a form different to their original state has been accidental or an unintended consequence of their use for some other purpose not directly concerned with their original content or history (e.g. as pastedowns or sewing guards).
- cutting = a single portion of a leaf, whose removal was guided by aesthetic or other criteria of selection, with the intention of preserving it separately from the rest of the manuscript.

Where necessary (particularly in the case of fragments), further brief description may be provided after the closing <objectType> tag, using the following terms:

- quire = a complete gathering of two or more bifolia, without a binding/covering.
- bifolium = two conjoint (but not necessarily contiguous) leaves, originally or still folded vertically down the middle, perhaps removed or otherwise detached from a codex.
- leaf = a single leaf

```
<extent>
<seg type="object">
<objectType>Fragment</objectType>, comprising two
originally contiguous strips of parchment, removed
from a binding. </seg> [...]
</extent>
```

Number of leaves

The number of leaves within a manuscript has generally been expressed using a formula that separates endleaves from the leaves at the 'core' of the volume (formed by gatherings of leaves whose structure can be determined in <collation>). E.g. ii + 320 + ii (i.e. a medieval manuscript opening with two post-medieval endleaves, then 320 medieval leaves, and closing with two post-medieval endleaves).

Sometimes, a formula might distinguish between different kinds of endleaf. Example: ii + 1 + 320 + ii (i.e. a medieval manuscript opening with two post-medieval endleaves, a single medieval leaf, then 320 medieval leaves, and closing with two post-medieval endleaves).

It can sometimes be difficult to distinguish whether such leaves as that denoted by ‘+ 1’ in the above formula are original (i.e. were included in the manuscript when it was first made), contemporary (i.e. included around that time), or were added at some later juncture as part of a rebinding during the medieval period. In any case, they are not part of the quire structure.

Since this kind of endleaf may contain (for example) annotations, added texts, or information of relevance to the manuscript’s medieval provenance, or may comprise leaves recycled from another medieval manuscript (and therefore bearing text in need of identification), the current guide recommends that these endleaves be distinguished both from others that were clearly added later and from the ‘core’ leaves in a volume.

Use `<measure>` to encode each group of leaves separately, with the attribute `@value` to provide the number of leaves within that group.

Use the following conventions:

- lower-case Roman numerals to refer to endleaves that were not part of the original manuscript and are demonstrably not medieval, `@type=laterEndleaf`
- Arabic numerals to refer to endleaves that are either original / contemporary / medieval, encoded as `@type=endleaf`
- Arabic numerals to refer to leaves that are the ‘core’ of the volume, encoded as: `@type=leaf`. (If the volume is paginated, use `@type=page`.)
- for rolls: Arabic numerals to refer to the number of membranes, encoded as: `@type=membrane`

The terms ‘medieval’ and ‘post-medieval’ have been avoided in order that it might be possible to apply the same vocabulary and encoding practice to the task of cataloguing early modern manuscripts.

```
<extent> [...] <seg type="leaf">
<measure quantity="2" type="laterEndleaf">ii</measure> + <measure quantity="1" type="endleaf">1</measure> +
<measure quantity="320" type="leaf">320</measure> + <measure quantity="2" type="laterEndleaf">ii</measure>
</seg>
</extent>
```

N.B. Note for retroconversion: catalogues do not always make it possible to distinguish endleaves from leaves. In particular, the Bodleian’s Summary Catalogue uses formulae such as “ii + 73”, where the front endleaves are enumerated (but modern / original leaves are not distinguished), but any rear endleaves are included in with the main block. In such cases mark up as follows:

```

<extent>
<num type="endleaf" value="2">ii</num> + <num type="leaf" value="73">73</num>
</extent>

```

Leaf dimensions

Use the tag <dimensions> to encode measurements of the leaves and the attribute @type to indicate what is being measured. The following values of @type may be used:

- leaf = one or more leaves
- roll = the total dimensions of a series of sheets stitched together
- membrane = a single sheet within a roll
- fragment = a remnant of a manuscript (potentially of various kinds and not necessarily in its original form)
- cutting = a single portion of a leaf, removed from a manuscript

Round measurements to the nearest 5mm - except for single-sheet documents or fragments.

Use the attribute @unit to specify the measurement system. Dimensions should be measured in mm. when cataloguing afresh. For retroconversion, follow whichever system the catalogue has used. Suggested values of @unit:

- mm
- cm
- inch

The @quantity attribute should be used to provide a machine-readable form of the measurement.

For a range of measurement (typically greater variation than 10mm between the leaves), use @min and @max:

```

<dimensions type="fragment" unit="mm">
<height quantity="176">176</height>
<width quantity="125">125</width>
</dimensions>
<dimensions type="leaf" unit="mm">
<height max="315" min="290">290-315</height>
<width max="180" min="160">160-180</width>
</dimensions>

```

The unit of measurement (mm., etc.) should not be expressed in prose but will be generated by the XSLT transformation.

In retroconversion, if the source catalogue uses "c.", the @precision attribute should be used. (The default value of @precision is assumed to be high.)

```

<dimensions type="leaf" unit="mm">
<height max="315" min="290"
precision="medium">c.
290</height>
<width max="180" min="160"
precision="medium">c.
160</width>
</dimensions>

```

If there is evidence of cropping (e.g. loss of text in the margins), record this using the attribute *@cert* with the value low

```

<dimensions type="leaf" unit="mm">
<height cert="low" quantity="290">290</height>
<width quantity="160">160</width>
</dimensions>
<note>Severely cropped in the upper
margin.</note>

```

<extent> will not presently accommodate <locus>. For manuscripts that are not composite, but which nonetheless contain sections (perhaps, but not necessarily a whole quire or quires) with dimensions different to others of the volume, it is not currently possible to provide separate measurements that are distinguished by folio range. These details may be recorded in a <note>.

For rolls, provide both the dimensions of the roll as a whole, followed by those of the membranes.

```

<dimensions type="roll" unit="mm">
<height quantity="4425">4425</height>
<width quantity="290">290</width>
</dimensions>
<dimensions type="membrane" unit="mm">
<height max="255" min="220">220-255</height>
<width quantity="290">290</width>
</dimensions>

```

Since the dimensions of fragments or cuttings could interfere with quantitative analyses of leaf dimensions, it is necessary to define them separately using the values *@fragment* or *@cutting*(see <objectType> for definitions of these terms). Regardless of what the fragment comprises, measurements of its total dimensions should be given, to the millimetre.

```

<dimensions type="fragment" unit="mm">
<height quantity="172">172</height>
<width quantity="93">93</width>
</dimensions>

```

It may be possible, in some instances, to provide or infer the original dimensions of a leaf from what survives in fragmentary form. e.g. a bifolium may have been flattened to form an endleaf but was not trimmed in the process; e.g. a fragment of papyrus may contain text on the recto and verso

sufficient to calculate an approximate number of lines and original size of the leaf. Use @cert to indicate where such inferences have been made, adding within <note> an explanation of the evidence.

```
<dimensions type="fragment" unit="mm">
<height quantity="183">183</height>
<width quantity="179">179</width>
</dimensions>
<dimensions type="leaf" unit="mm">
<height cert="high" quantity="179">179</height>
<width cert="high" quantity="106">106</width>
</dimensions>
<note>The fragment comprises a flattened bifolium,
trimmed along its original left-hand edge and
rotated 45 degrees anti-clockwise and inserted into
the volume as a pastedown. The right-hand edge
appears to have been left untrimmed. </note>

<dimensions type="fragment" unit="mm">
<height quantity="81">81</height>
<width quantity="48">48</width>
</dimensions>
<dimensions type="leaf" unit="mm">
<height cert="low" quantity="240">240</height>
<width cert="low" quantity="140">140</width>
</dimensions>
<note>The dimensions of the original leaf have been
inferred from the amount of text remaining on the
recto and verso and the likely space required to
copy the intervening text between the end of the
recto and the beginning of the verso. </note>
```

Measurements of the ruled and/or written spaces is often best given under <layout>. However, it is recognised that in printed catalogues, these measurements usually follow immediately on from measurements of leaf size (usually in brackets). In order to accommodate the continuation of this practice, and assist in retroconversion, the present guide accepts that it may be desirable to give measurements of ruled and/or written spaces under <extent>. Follow the practices as outlined above, using the attribute @type with the values ruled or written as appropriate.

Concluding examples:

```
<extent>
<seg type="leaf">
<num type="later_endleaf" value="4">iv</num> +
<num type="leaf" value="288">288</num> + <num type="later_endleaf" value="2">ii</num>
</seg>
<seg type="dimensions">
<dimensions type="leaf" unit="mm">
<height quantity="350">350</height>
```

```

<width quantity="245">245</width>
</dimensions>
</seg>
</extent>

<extent>
<seg type="object">
<objectType>Cutting</objectType>, of a large
historiated initial. </seg>
<seg type="leaf">
<num type="leaf">1</num>
</seg>
<seg type="dimensions">
<dimensions type="fragment" unit="mm">
<height quantity="334">334</height>
<width quantity="291">291</width>
</dimensions>
<dimensions type="leaf" unit="mm">
<height cert="high" quantity="680">680</height>
<width cert="high" quantity="450">450</width>
</dimensions>
<note>The cutting was removed from Florence,
Biblioteca Laurenziana, Cod. Corale 2, from which
total leaf dimensions have been taken.</note>
</seg>
</extent>

```

Foliation

The `<foliation>` element is used to provide information about the systems used to number the folios or pages in the manuscript. It should record where and in what medium the numbers are written, and when this was done, and the sequence of those numbers. Where multiple systems have been used these can be referred to elsewhere if `@xml:id` attributes are used. For example:

```

<foliation xml:id="original">
<p>Original foliation in red Arab numerals in the outer
margin of each recto</p>
</foliation>
<foliation xml:id="modern">
<p>Additional pagination in pencil in <locus from="1b" to="67a">ff. 1b-67a</locus>
</p>
</foliation>

```

The dating attributes `@notBefore`, `@notAfter` and (less probably) `@when` may be used if desired to (note: this is a customization and not currently part of the TEI P5 standard).

```

<foliation notAfter="1500" notBefore="1400">Fifteenth-century foliation in roman
numerals.</foliation>

```

The `<fw>` element can be used to describe running heads. For example:

```
<foliation>
<p>
<fw place="left" type="pag" xml:lang="bo">Has pagination
in Tibetan</fw>
<fw place="left" type="sig" xml:lang="bo">氵</fw>
</p>
</foliation>
```

Collation

The collation formula should be given inside the `<formula>` element.

The `@mainStructures` attribute (a customization not currently part of the TEI P5 standard) may be used to record the most frequently occurring quire structure(s). The value of the attribute should be the number of leaves in the most frequently-occurring structure(s). A single value indicates that the given quire structure occurs in approximately 80% or more of quires. Multiple values indicate that the given structures in combination account for approximately 80% or more of quires; the most frequently-occurring structure should be placed first.

```
<collation mainStructures="8">
<formula>I-XXII(8),
XXIII(3)</formula>
</collation>
<collation mainStructures="12 16">
<formula>I(14),
II-III(12), IV(16), V-VI(12), VII(16), VIII-XI(12),
XII(16), XIII(12), XIV(16), XV(10), XVI(16),
XVII(13)</formula>
</collation>
```

The `<formula>` element should be used for brief collation formulae. For more detailed formulae, use the `<list>` element with attribute `@type` of value `collationFormula`.

```
<collation>
<list type="collationFormula">
<item>2 modern paper endleaves</item>
<item>1 medieval endleaf</item>
<item>Quire 1<hi rend="superscript">6</hi> (fols
1-6)</item>
<item>Quire 2<hi rend="superscript">8</hi> (fols
7-14)</item>
<item>Quire 3<hi rend="superscript">10</hi> (fols
15-24)</item>
<item>Quire 4<hi rend="superscript">12</hi> (fols
25-36)</item>
<item>2 modern paper endleaves</item>
```

```

</list>
</collation>
<!-- todo: this should be regarded as a temporary solution? toDO: visColl? --&gt;
</pre>

```

The following terminology is recommended:

Not present	when a leaf has been removed or lost, without affecting the contents of the volume, but for reasons that cannot presently be established.
Excised	when a leaf has clearly been cut out deliberately (esp. if blank).
Missing	when a leaf has been lost, perhaps but not necessarily accidentally, causing the text or decorative scheme to become imperfect.
Cancelled	when a leaf has been removed but there is no evident interruption to the text or decorative scheme (e.g. leaf with an error, removed during copying).
Inserted	when an extra leaf is contemporary with the production of the manuscript (e.g. a miniature on a single leaf in a Book of Hours).
Added	when an extra leaf is a later insertion.

Record quire or leaf signatures in the <signatures> element. Use the attribute @type to distinguish leaf and quire signatures. (NB this is a customization and not currently part of the TEI standard.)

- leaf: the description refers to leaf or bifolium signatures (usually located in the lower right-hand corner of the recto side of the leaves in the first half of a quire, usually in alphanumerical sequence).
- quire: the description refers to quire signatures or numbers, usually on the verso of the last leaf of the quire, or sometimes the recto of the first leaf, which assign a sequence of numbers, letters or a combination thereof to the sequence of quires.

```

<signatures type="leaf">Bifolium signatures, a-k,  

accompanying Roman numerals, on Quires 1-10; none  

thereafter.</signatures>  

<signatures type="quire">Quires numbered 1-12 in a  

sixteenth-century hand.</signatures>

```

Record the catchwords in the <catchwords> element.

For 0, the collation of each part should be recorded at the level of the msPart; it may also be recorded at the level of the manuscript as a whole if this aids clarity. In retroconversion this is likely to involve reorganization of the formula.

Condition

This element is used to provide a brief description of the overall condition of the manuscript: detached, loose, torn, mutilated or otherwise damaged leaves; flaking ink or pigments or 'bleed-through'; deliberate damage inflicted upon decorative elements; post-medieval 'touching up' of the text or decoration; damp, creasing or anything else that affects the colouration of the parchment or paper or affects the legibility of the text; weak joints, detached boards, loose headbands and other

damage to bindings. It is not necessary to repeat information about excised / missing / cancelled leaves or gatherings that has already been provided under <collation>. If there is a large quantity of information to record, use <p> to separate it into paragraphs.

```
<condition>
<p>Several of the miniatures have been rubbed and the
pigments smudged (<locus from="10v" to="10v">10v</locus>, <locus from="26v" to="26v">26v</locus>,
<locus from="30v" to="30v">30v</locus>, <locus from="33v" to="33v">33v</locus>,
<locus from="44v" to="44v">44v</locus>, <locus from="51v" to="51v">51v</locus>).</p>
<p>Pigments have also flaked away in places (<locus from="10v" to="10v">10v</locus>,
<locus from="59v" to="51v">59v</locus>) and transferred to facing
leaves (<locus from="44v" to="45r">44v-45r</locus>).</p>
</condition>
```

Layout Description

The layout section (which might more fully be called ‘layout and preparation of the page’) should be used to record: written and/or ruled space (but see also under Extent); number of columns and number of written and/or ruled lines; how and according to what pattern ruling was executed; whether the writing is ‘above’ or ‘below’ top line; and evidence for pricking of the page. This section comprises one or more <layout> elements inside the <layoutDesc> element.

If desired, the <seg> element may be used to divide the content of a <layout> element, using attribute @type to label the sections, suggested values ruling, pricking.

Give the number of columns and ruled lines in the <layout> element using the @columns and @ruledLines or @writtenLines attribute. If the number of columns and/or written or ruled lines varies give the minimum and maximum values with whitespace in-between.

In retroconversion: if a varying number of lines and/or columns is given, but a typical number is specified, encode the typical number in the attributes.

```
<layout columns="2">1-10 cols. (typically 2)</layout>
```

Give the height and width of the writing area in mm (with 5 mm precision) in the <dimensions> element (@type attribute with value written, preceding this with the explanatory text ‘written space’).

```
<layout columns="1" writtenLines="30">30 long lines; written
space <dimensions type="written" unit="mm">
<height quantity="290">290</height>
<width quantity="160">160</width>
</dimensions>
</layout>
<layoutDesc>
<layout columns="1" ruledLines="28">28 lines ruled in pale
brown ink, with single vertical bounding lines,
```

```

extending the full height of the page, ruled on the
flesh side of the leaves with an instrument which
produced a scored line, but also often left a brown
'crayon' trace. <seg type="pricking">
<hi rend="smallcaps">PRICKINGS</hi> are often visible
in the upper and lower margins, and in the outer
margin c.7 mm. below the bottom ruled
line.</seg>
</layout>
</layoutDesc>
```

In most descriptions, you need only provide a count of the number of written lines. If there is a discernible difference between the number of lines ruled and the number of lines written, use both *@ruledLines* and *@writtenLines* in order to differentiate.

There is as yet no straightforward means of recording the varying dimensions of columns and intercolumnar margins for the more complex, multi-column layouts such as those found in glossed books. Give a prose description instead.

Record the written (and/or ruled) space in the *<dimensions>* element with *@type* of written/ruled as appropriate.

The description of the ruling type may be according to: a printed repertory (use the standard markup for repertoria); a verbal description; the formula established by D. Muzerelle, *De re rigatoria* [<http://www.palaeographia.org/muzerelle/index.htm>]. In the latter case the formula should be enclosed in a *<formula>* element with attribute *@notation* of value Muzerelle

```

<layoutDesc>
<layout columns="2" writtenLines="24 52">
<locus from="29r" scheme="folios" to="30v">Fols.
29r-30v</locus>; written space <dimensions type="written">
<height quantity="165" unit="mm">165</height>
<width quantity="115" unit="mm">115</width>
</dimensions>
<note>Main text always 24 lines per page. In the
commentary surrounding the main text there around
twice as many lines per page.</note>
</layout>
</layoutDesc>
<layout columns="1"
rulingMedium="leadpoint" topLine="above" writtenLines="25">25 long lines. <seg type="pricking">Pricked in the
outer margins.</seg> Ruled in leadpoint;
ruling often very faint, with double vertical bounding lines
extending the full height of the page, and the first, third,
twenty-third and twenty-fifth horizontal lines extending the
full width of the page (Muzerelle, <ref target="http://www.palaeographia.org/muzerelle/mastara.htm">Mastara</ref>,
formula <formula notation="Muzerelle">2-2/0/101-101/J</formula>). Written above top line.
Written space <dimensions type="written" unit="mm">
<height max="125" min="115">c. 115-125</height>
```

```
<width max="85" min="75">75-85</width>
</dimensions>
</layout>
```

If the layout varies between different sections of the manuscript, use separate `<layout>` elements to record this.

Complex or unusual layouts

Complex or unusual layouts may be encoded using the `@type` and `@subtype` attributes on `<layout>`. (Note that this customization is not currently part of the TEI P5 standard.) For example:

To encode the layout of glossed manuscripts in *textus inclusus* format.

```
<layout columns="2" type="text"
writtenLines="34 35">Text in 2 cols. of c. 34/35 lines, main text block <dimensions type="written" unit="mm">
<height>162</height>
<width>96</width>
</dimensions>
</layout>
<layout columns="2" type="gloss"
writtenLines="66 76">Gloss in 2 cols. of c. 66-76 lines, text block including gloss
<dimensions type="written" unit="mm">
<height>265</height>
<width>166</width>
</dimensions>
</layout>
```

Layout of fragments

The `@type` and `@subtype` attributes should be used to encode the layout of fragments if the written area of a page is not fully preserved.

To encode the existing form of a fragment, use `@type` with fragment

If neither the full height or width of the written space is preserved:

```
<layout columns="1" type="fragment"
writtenLines="12">Lower outer quarter of the leaf: 1 col., 12 lines.</layout>
```

If the full height of the written area is preserved:

```
<layout columns="1" subtype="fullHeight"
type="fragment" writtenLines="55">(at least) 1 col., 55 lines</layout>
```

If the full width of the written area is preserved:

```
<layout columns="2" subtype="fullWidth"
type="fragment" writtenLines="46">2 cols., at least 46 lines</layout>
```

For processing purposes this encoding should be interpreted as, respectively: at least one column, at least 12 lines; at least one column, 55 lines; two columns, at least 46 lines.

If the original layout can be reconstructed with some confidence, use *@type* with reconstruction and a relevant value for the *@cert* attribute.

```
<layout cert="high" columns="2"
type="reconstruction" writtenLines="44">2 cols., originally 44 lines (42 lines extant at fullest extent, one fragmentary
line at the bottom, one line missing at the top), written space <dimensions type="written" unit="mm">
<height precision="low" quantity="240">c. 240</height>
<width precision="low" quantity="150">c. 150</width>
</dimensions>
</layout>
```

Description of Hands

Each distinct hand and/or script in the codicological unit should be described in a separate *<handNote>* element in the *<handDesc>* element. The *<handDesc>* element itself has an attribute *@hands* which can be used to record the number of hands identified. This is optional but recommended. The value of the attribute should be the number of hands involved in the original production of the manuscripts and should not include later additions or annotations.

The *<handNote>* element may have an *@xml:id* attribute with the values hand-1, hand-2 etc, numbered in the order of appearance in the manuscript. If the same hand occurs in another unit the attribute *@sameAs* may be used with a reference to the *@xml:id* of that *<handNote>*.

The folios where the hand occurs should be specified and may be encoded using the *<locus>* or *<locusGrp>* element. Where the scribe is identifiable, either from the writing or a subscription, give the name in a *<persName>* element using the *@key* attribute pointing to the persons authority file, and the *@role* attribute with value scr.

The *@scope* attribute can be used to indicate the extent of the hand's appearance in the manuscript. Its values can be one of:

- sole
- major
- minor

The *@script* attribute may be used to provide a high-level classification of the script. Suggested values in Western manuscripts are:

- capitalsSquare
- capitalsRustic

- `uncial`
- `halfUncial`
- `minusculeInsular`
- `minusculeVernacular` (use for English vernacular minuscule / Anglo-Saxon minuscule)
- `minusculeCaroline` (use for both English and continental variants of the script)
- `minuscule` (other forms of minuscule: Beneventan, Luxeui, etc.)
- `protogothic` ('*praegothica*')
- `textualisNorthern`
- `textualisSouthern`
- `semitextualis`
- `cursivaAntiquior` ('*anglicana*', '*anglicana formata*', etc.)
- `cursiva` ('*cancelleresca*', '*bastarda*', '*lettre batarde*', '*secretary*')
- `hybrida` ('*semihybrida*', '*loopless bastarda*', '*fractura*', '*mercantesca*')
- `gothicoAntiqua` ('*fere-humanistica*', '*gothico-humanistica*')
- `humanisticaTextualis`
- `humanisticaSemitextualis`
- `humanisticaCursiva`

The classification for early scripts is based on Brown (1990) with modifications, for Gothic scripts on Derolez (2003), for humanistic scripts on Derolez (2011).

The attribute `@execution` can be used to describe the formality of the script's execution, according to the classifications developed by Lieftinck, Gumbert, and Derolez. Note that this customization is not currently part of the TEI P5 standard.

- `formata`: execution is calligraphic
- `libraria`: a normal level of execution
- `currens`: execution is informal

In Islamicate manuscripts suggested `@script` values are:

- `muhaqqaq`
- `rayhani`
- `naskh`
- `maghribi`
- `bihari`
- `nasta_liq`
- `thuluth`
- `tawqi_`
- `riqa_`
- `ghubar`
- `ta_liq`
- `diwani`
- `ruq_ah`

- siyaqah
- unknown

For further levels of classification the <term> element with @type of script may be used.

```
<handDesc hands="1">
  <handNote script="cursivaAntiquior">Written in <term type="script">anglicana</term> by a single
  scribe.</handNote>
</handDesc>
```

Punctuation should be described in the <handNote> element. Use the <term> element with attribute @type of value punctuation to mark up particular types of punctuation, if desired.

```
<handNote>Written in gothic <term type="script">textura
  quadrata</term>. Punctuation by <term type="punctuation">point</term> and <term type="punctuation">double
  point</term>.</handNote>
```

Musical Notation

Musical notation should be described in a <p> element in the <musicNotation> element with a <locus> element. Multiple types of notation should appear in separate <p> elements.

```
<musicNotation>
  <p>8 long staves with square notation</p>
</musicNotation>
```

Description of the Decoration

The <decoDesc> element contains a description of the decoration in the manuscript or codicological unit, together with other ‘decorative’ aspects of the presentation of the text such as rubrication. It can only contain the elements <p>, <summary>, and <decoNote>.

Within the tag <decoDesc>, use <decoNote> to provide a hierarchical breakdown of the decoration in the manuscript, in the order given in the following table, with the appropriate values of @type attribute.

Miniatures (or coloured drawings), listed in the following order: full-page, half-page, small, column; use for painted or tinted images, whether part of an original decorative scheme or added.	miniature
Uncoloured drawings or sketches, whether part of an original decorative scheme or added.	drawing
Bas-de-page scenes	bas-de-page
Borders, in the following order: historiated, other; use for painted borders of any type (including for example historiated, inhabited, foliate)	border
Diagram	diagram
Map	map
Headpiece	headpiece
Canon table	canonTable
Carpet page	carpetPage
Historiated initials (i.e., containing an identifiable narrative scene) (Brown: historiated initial); initials,	histInit

usually painted, containing identifiable persons or narrative scenes usually related to the text.	
decorated initials (Brown: decorated initial, anthropomorphic initial, zoomorphic initial, gymnastic initial, inhabited initial). Other initials with significant decorative features, usually painted; includes 'arabesque' and 'silhouette' initials.	deInit
coloured initials (i.e. of a single colour with no or minimal decorative features)	collInit
initials with penwork flourishing (Reallexikon zur Deutschen Kunstgeschichte: fleuronné) (Brown: pen-flourished initial, littera florissa). Initials with "fine linear embellishment" (Brown) often in a contrasting colour (includes 'puzzle' initials); borders of similar embellishment.	flourInit
chrysography (i.e. writing in gold)	chrysography
plain initials (i.e. in the ink of the text and with no or minimal decorative features)	plainInit
Line fillers	lineFill
cadels	cadel
instructions	instructions
Spaces left for decoration	unfilled
None (if an existing decoration being retro-converted specifies this)	none
rubrication	rubrication

In Fihrist, the following values for the `@type` attribute should be used:

- border
- diagram
- frieze
- illustration
- initial
- map
- marginal
- miniature
- mixed
- other
- paratext
- printmark
- publishmark
- rubrication
- secondary
- tooling
- unspecified
- unwan
- vignette

Artists should be identified using the `<persName>` element with `@role = art` and `@key` referring to the persons authority file.

```
<decoDesc>
<decoNote type="miniature">
```

```

<p>Two full-page miniatures, framed by green, blue,
orange, ochre or pink panels linked by gold
quadrilobes and surrounded by short black sprays
terminating in gold disks and ivy leaves.</p>
<p>The second miniature is signed 'Willelmus de monte
acuto me fecit' by the artist <persName key="person_1234" role="art">William Montague (fl.
1390s?) (<locus from="37r" to="37r">37r</locus>).</persName>
</p>
</decoNote>
</decoDesc>

```

To provide a more structured entry in the case of detailed descriptions of decoration, use the `<list>`, `<head>`, and `<item>` elements.

```

<!-- abbreviated from MS. Buchanan e. 10 --><decoNote type="histInit">
<list>
<head>Two five-line historiated initials:</head>
<item>
<locus from="19v" to="19v">(fol. 19v)</locus>
Obsecro te. Virgin and Child enthroned; the Virgin
holding a red fruit?.</item>
<item>
<locus from="23r" to="23r">(fol. 23r)</locus> O
intemerata. Pietà. </item>
</list>
</decoNote>
<decoNote type="decInit">Four- or three-line initials in blue
and red, enclosing foliage, on a gold ground, at the start
of each text with a large miniature; two-line initials in
gold, on a blue and red ground with white tracery, to
psalms, capitula, lessons, etc. and the KL monograms in the
calendar; similar one-line initials to verses and other
minor divisions; similar line-fillers throughout.</decoNote>

```

The subjects of miniatures can be classified using the `<term>` element with attribute `@type` of value iconography. The `@ref` attribute can be used to point to a thesaurus, such as [Iconclass](#).

```

<decoNote type="histInit">
<list>
<head>One six-line historiated initial: </head>
<item>
<locus from="49r" to="49r">(fol. 49r)</locus>
Hours of the Virgin, Lauds. <term ref="http://www.iconclass.org/rkd/73A6"
type="iconography">Visitation</term>. </item>
</list>
</decoNote>

```

Aspects of the manuscript relating to the presentation of the text - notably rubrication - should also be included in the `<decoDesc>` element (rather than in the `<layout>` element, using `<decoNote>` with attribute `@type` of value rubrication).

Additions

Marginalia, notes, and other additions of interest should usually be recorded in the `<additions>` element, inside one or more `<p>` or `<note>` elements. The `<note>` element can have the `@type` and `@subtype` attributes. Use `<locus>` to specify the location of these features.

If the language of the marginalia is significant (e.g., Latin marginalia in a Greek manuscript), the marginalia will need to be recorded as an additional text using `<msItem>` in `<msContents>`.

```
<msItem xml:id="MS_Auct_T_2_6-item2">
<note subtype="gloss" type="additions">Marginal and interlinear
Latin glosses.</note>
<textLang mainLang="la">Latin</textLang>
</msItem>
```

Binding Description

The binding should be described in one or more paragraphs (`<p>`) in a `<binding>` element inside the `<bindingDesc>` element. The standard dating attributes should be used on the `<binding>` element if information about the date of the binding is available.

The following order may be followed in the description:

- covering material and coverage (full, half, quarter; textile; limp vellum; treasure)
- chemise (alum-tawed, textile)
- board material (wooden boards, pasteboard)
- tooling patterns (blind, gold)
- spine covering and tooling, incl. labels
- metalwork fittings (plates, plaques, enamels, bosses, cornerpieces, strap and pin, clasps, chain staples).
- inlaid/inset plaques
- labels (esp. horn-plaques)

Key elements of the description may be marked with the `<term>` with relevant `@type` attribute and with attribute `@ref` referring to the appropriate URI in the Ligatus thesaurus.

Give the height, width and depth of the binding may be given in mm (with 5 mm precision) in the `<dimensions>` element (`@type` attribute with value binding).

A description of decorative features on the binding can be recorded in one or more `<decoNote>` elements (note that this needs to be outside the `<p>` element as a child of `<binding>`)

Use the <condition> element to record repairs to the binding, such as rebacking.

Fore-edge painting or decoration should be described inside a <decoDesc> element, in a <decoNote> element with attribute @type of value foreedge.

Bookmarks and other page markers should be described in a separate paragraph in the binding section, using where possible the vocabulary of the Ligatus thesaurus, and linking to that vocabulary using the <term> element with attribute @type of value bookmark and relevant @ref attribute.

```
<bindingDesc>
<binding notAfter="1700" notBefore="1600">
<p>Light brown <term ref="http://w3id.org/lob/concept/1238"
type="material">calfskin</term> over paste-laminate boards,
leather label on spine with title and shelfmark
tooled in gold, gauffered fore-edges. 17th
century.</p>
<condition>Rebacked.</condition>
<p>
<term ref="http://www.ligatus.org.uk/lob/concept/2945"
type="bookmark">Leaf tab markers</term>.</p>
</binding>
</bindingDesc>
```

Evidence of former bindings, or the reuse of earlier binding material in a modern binding, should be recorded in a separate <binding> element.

Note that all the above may require restructuring of an original description during retroconversion.

```
<bindingDesc>
<binding notAfter="1900" notBefore="1600">
<p>Sewing not visible; tightly rebound between
19th-century pasteboards, reusing earlier panels
(see below); the centre of each cover inlaid with a
17th-century oval medallion of red leather tooled in
gilt (perhaps replacing the identifying mark of a
previous owner); the spine similarly tooled, without
raised bands or title-piece (similar in design to
<hi rend="italic">ibid</hi>. pl. XIXa); coloured
endbands; the edges of the leaves and boards gilt.
Boxed.</p>
</binding>
<binding notAfter="1590" notBefore="1580">
<p>The binding re-uses panels of 16th-century brown
leather with gilt tooling <foreign rend="italic">à
la fanfare</foreign>, Paris c. 1580-90, in the
style associated with Clovis Eve (of the bindings
ill. in Hobson, <title>Les reliures à la
fanfare</title>, the boards are closest in general
design to pl. XXI b).</p>
```

```
</binding>  
</bindingDesc>
```

Seals

The `<sealDesc>` element supplies information about the seals attached to documents. It can either contain a text description in `<p>` tags, or any number of `<seal>` elements. These can be numbered using `@n` attributes.

The seal impression of stamps of ownership may be described in `<decoDesc>`, in stylistic and decorative terms, or in `<provenance>` as regards its textual content.

Accompanying material

The `<accMat>` element may be used for brief descriptions of endleaves, waste leaves and similar material that are not part of the 'original' codex but were supplied during a binding process. If a detailed codicological description is required, use `<msPart>`

Use `<p>` to split up descriptions of multiple materials, and `<locus>` to identifying their locations.

History

The `<history>` element should include information about the origin, provenance and acquisition of the manuscript.

Origin

In the `<origin>` element specify date (`<origDate>`) and place (`<origPlace>`) (if known) of the manuscript's production. If not known, state this in a `<p>` element. Do not enclose a statement such as "No date" or "n.d." with `<origDate>` tags.

origDate

Dating attributes from the set `@notBefore`, `@notAfter`, `@from`, `@to` and `@when` MUST be used for `<origDate>`

`@from` and `@to` denote a known period of writing, presumed to be more or less continuous, beginning at one date and ending at another. `@notBefore` and `@notAfter` denote the terminus a quo and terminus ad quem within which the writing is believed to have occurred.

The values of those attributes are a date, starting with the year, then the month, then the day, separated by hyphens (but most often just a year, always expressed using four-digits) must be in the Gregorian calendar. the `@calendar` attribute records the calendar system used by the expression of the date in the text enclosed by the `<origDate>` tags. The text is for display, the attributes are the machine-readable interpretation. For example:

```
<origDate calendar="#Hijri-qamari"
when="1684">1096
AH</origDate>
```

In retroconversion, the values given to the element and its attributes should reflect the conventions of the particular catalogue as expressed in the catalogue or, if necessary, as inferred by the encoder. (If inferred, a note to this effect may be added in <encodingDesc>.)

```
<origDate notAfter="1025" notBefore="1000">s. xi<hi rend="superscript">in</hi>
</origDate>
```

Values used in the Bodleian medieval catalogue (intended to capture the usage of the Summary Catalogue and Paecht and Alexander) are as follows:

Early 14th century	1300-1310
Mid 14th century	1340-1360
Late 14th century	1390-1400
14th century, first quarter	1300-1325

Etc.

Values of dating attributes should be inclusive, i.e. 1000-1050, not 1001-1050 or 1000-1049.

The attribute *@evidence* MAY be used to indicate the evidence for dating and localization. It is assumed that this will usually be equivalent to conjecture. If there is reasonable certainty about the dating or localization (the manuscript is 'dated or datable') this SHOULD be indicated using the attribute *@cert* with value high, and the nature of the evidence may be specified with the *@evidence* attribute.

In retroconversion, authoritative sources may differ regarding the date (or origin) of a manuscript. This can also be recorded using multiple <origDate> elements. (The *@resp* attribute may be used on the element to indicate responsibility in a machine-readable way).

```
<origDate calendar="Gregorian"
notAfter="1300" notBefore="1290">13th century, end (Hutter)</origDate>
or
<origDate calendar="Gregorian"
notAfter="1325" notBefore="1300">14th century, first quarter
(Palau)</origDate>
```

For manuscripts with significant later additions, textual or decorative, use additional <origDate> elements with *@type* of additions

```
<origDate calendar="Gregorian"
notAfter="1225" notBefore="1200">13th century, first quarter</origDate>;
```

```

<origDate calendar="Gregorian"
notAfter="1500" notBefore="1400" type="additions">additions, 15th
century</origDate>

<origDate calendar="Gregorian" cert="high"
when="1488">1488
(fols. 126-208)</origDate>;
<origDate calendar="Gregorian" cert="high"
notAfter="1488" notBefore="1464">1464 × 1488 (fol. 1-125v)</origDate>

```

origPlace

The content of <origPlace> should where possible be structured in the order (where relevant), country, settlement, institution. These should be marked up using the <country>, <settlement>, and <org> elements, which MUST have attributes @key linking to the places authority file. Or, in catalogues such as Fihrist which have a subjects authority file instead of a places one, the @key attribute should be "subject_" followed by the Library of Congress Name Authority identifier (e.g. "subject_n12345678").

There MUST be a country or country-like entity (see below), inside a <country> tag, if the <origPlace> element is used.

In Western manuscripts, countries of origin are typically expressed with reference to modern countries with some exceptions. Examples: England, France, Spain, Italy, Germany, Austria, Switzerland, but Bohemia, Dalmatia, Serbia, Flanders.

For manuscripts with significant later additions, textual or decorative, use additional <origPlace> elements with @type of additions

```

<origPlace>
  <country key="place_1000070">French</country>, <region key="place_7024267">Brittany</region>
</origPlace>
<origPlace type="additions">additions, <country key="place_7002445">England</country>
</origPlace>

```

For manuscripts produced in more than one place (or, where there is more than one potential place of origin), use multiple <origPlace> elements, with the @cert attribute if necessary.

```

<origPlace cert="low">
  <country key="place_1000080">Italian (?)</country>
</origPlace> or
<origPlace cert="low">
  <country key="place_1000070">French</country>,
  <region>South</region> (?)
</origPlace>

```

Provenance

Record the different stages in the provenance in one or more <provenance> elements.

There are different conventions for the presentation of provenance evidence. Recommended best practice in these guidelines (which may involve some restructuring of material in the case of retroconversion) is that where possible each provenance event should occur in its own <provenance> element, which should have relevant dating attributes (@when, @notBefore, etc.). (They may alternatively contain <date> elements with those attributes.) As elsewhere, @from and @to denote a known period, presumed to be more or less continuous, beginning at one date and ending at another. @notBefore and @notAfter denote the terminus a quo and terminus ad quem within which the writing is believed to have occurred. @when denotes a single event (such as a dated signature or the donation of an item to a library). People involved in the transfer of ownership should be marked up with <persName> tags, with a @role attribute (a [Library of Congress relator code](#), usually "fmo" for former owner).

Pressmarks and shelfmarks should be recorded in a <q> element with attribute @type, value pressmark; see 0. It is not necessary to mark up pressmarks and shelfmarks which are already recorded as manuscript identifiers.

```
<acquisition notAfter="1468">At the head of f. iii<hi rend="superscript">v</hi> is 'Liber domus scolarium de  
Merton ex dono magistro <persName key="person_2899" role="fmo dnr">Hamondi Haydok</persName>  
incathenandus in libraria anno Domini  
m<hi rend="superscript">mo</hi>cccc<hi rend="superscript">o</hi>lxviii<hi rend="superscript">o</hi>', in the same  
hand as Wyght's <foreign>ex dono</foreign> in MS 38. For  
Hammond Haydok, see MS 16. On the front pastedown is a brief  
table of contents, s. xvii, and <q type="pressmark">N. 3.  
13. Art:</q>, canc. and replaced with 'A. 1. 10 (XXXIX)'  
in red. The College bookplate. At the head of f. i is <q>M.  
A. 2. 5</q>, s. xvii. '13' is inked on the  
foredge.</acquisition>
```

Acquisition

The <acquisition> element should describe the last stage of the manuscript's history, i.e. how it was acquired by its present owners. It SHOULD have relevant dating attributes. Because the present owner, location etc. of the manuscript are recorded elsewhere in the manuscript description, it is NOT necessary to encode them using <orgName> or <persName> elements.

Note the usage of the different dating attributes in the following example.

```
<provenance notAfter="1833">  
<persName key="person_2854" role="fmo">William Wilson</persName>, F.S.A.  
(-1832?), of the Minories, his sale, Christie's, 31 Jan.-1  
Feb. 1833, lot 56 on 1 Feb.; bought by Thorpe for £53.  
11s.  
</provenance>
```

```
<provenance from="1833" to="1834">Purchased from Thorpe by  
<persName key="person_69848690" role="fmo">Douce</persName>, Feb. 1833.</provenance>  
<acquisition when="1834">Bequeathed by Douce to the Bodleian in  
1834.</acquisition>
```

The `<acquisition>` element is also the place to record any funding bodies which contributed to the cost of purchasing the manuscript. Each should be tagged as `<orgName>` elements with a `@role` attribute of either "spn" or "fnd". The websites of sponsors, and their logos, can be included. For example:

```
<acquisition> Purchased with the support of  
<orgName role="spn">  
  <ref target="https://visit.bodleian.ox.ac.uk/friends-of-the-bodleian">Friends of the Bodleian</ref>  
</orgName>,  
and the  
<orgName role="spn">  
  <ref target="https://www.vam.ac.uk/purchasegrantfund">V&amp;A Purchase Grant Fund</ref>  
  <graphic url="https://www.fihrist.org.uk/images/logos/vampgf250.png"/>  
</orgName>, and a private donor.  
</acquisition>
```

Ideally the `@url` attribute of the `<graphic>` element should point to an image hosted by the funding organization. The `<graphic>` element cannot be a child of the `<funder>` element, but must be enclosed in a `<persName>` or `<orgName>` element.

Contributions to the cost of cataloguing the manuscript should be recorded in the 0.

Additional

The `<additional>` element is used to provide: information about the source of the description; information about the availability and custodial history of the manuscript; information about surrogates; bibliography; and links to online resources.

Record source and history

The `<source>` element, contained in `<recordHist>`, provides a prose description of the source(s) from which the description has been derived; this information will overlap with the information in `<respStmt>`. It may contain `<listBibl>` and `<bibl>` elements.

```
<adminInfo>  
<recordHist>  
<source>Description adapted (2018) from the  
following sources: <listBibl>  
<bibl>  
<title>The Douce Legacy</title> (1984), no.  
  244</bibl>  
<bibl>Pächt and Alexander</bibl>
```

```

<bibl>S. J. P. Van Dijk, <title>Handlist of the
Latin Liturgical Manuscripts in the Bodleian
Library Oxford : Vol. 2: Office Books</title>
(typescript, 1957)</bibl>
</listBibl> Additional description of content and
decoration by Matthew Holford, March 2018.
Previously described in the Summary Catalogue. <listBibl>
<bibl facs="aaz0626.gif" type="SC">Summary
Catalogue, vol. 4, p. 607</bibl>
<bibl facs="aaz0627.gif" type="SC">Summary
Catalogue, vol. 4, p. 608</bibl>
</listBibl>
</source>
</recordHist>
</adminInfo>
```

Availability

The `<availability>` element can be used to supply information about the availability of a manuscript, using the `@status` attribute. Valid values for status are free, unknown, restricted, offsite, exhibition, printcat, none. It may also contain information about the images or text, such as any restrictions on their use or distribution, their copyright status, etc.

Custodial History

The `<custodialHist>` element can be used to describe a manuscript's custodial history (e.g. conservation, exhibitions) either as prose tagged with `<p>` elements, or as a series of custodial events, using the `<custEvent>` element with attributes `@type`, `@when`, etc.

The `<custEvent>` element is currently used at the Bodleian to record barcoding of manuscripts:

```

<custodialHist>
<custEvent type="barcode">Barcode: <idno type="barcode">603303329</idno>
</custEvent>
</custodialHist>
```

Surrogates

The `<surrogates>` element, which follows `<recordHist>`, is used to link to digital or other facsimiles where these are hosted independently from the catalogue. The structure of a typical entry is shown below. The `@subtype` attribute on the `<bibl>` element has the values full, where a manuscript has been digitized in full, or partial, where only selected items are available.

```

<surrogates>
<listBibl>
<bibl subtype="full"
      type="digital-facsimile">
```

```

<ref target="https://digital.bodleian.ox.ac.uk/objects/34a6037b-12e8-4b12-8920-26c33914fe0e">
<title>Digital Bodleian</title>
</ref>
<note>(full digital facsimile)</note>
</bibl>
</listBibl>
</surrogates>

```

This section should also be used to record the availability of microfilms.

```

<surrogates>
<bibl subtype="partial"
type="digital-facsimile">
<ref target="https://digital.bodleian.ox.ac.uk/objects/4e3e7d80-c49a-40bd-9aff-a6452f196fa1">
<title>Digital Bodleian</title>
</ref>
<note>(3 images from 35mm slides)</note>
</bibl>
<bibl subtype="full" type="microfilm">Microfilm available in the open shelf collections in the Weston Library (R. Films 101)</bibl>
</surrogates>

```

Bibliography

The bibliography of works referring to the manuscript should be recorded in the <additional> element in a <listBibl> element. In the Bodleian medieval catalogue only major printed descriptions or reproductions of the manuscript are listed here; other items should be recorded in the Zotero bibliography. The works should be listed in a chronological order, with the most recent item first.

This section is also used to provide links to online resources such as Pinakes, Trismegistos, JONAS etc. Online resources are placed in a separate <listBibl> element with the heading <head> 'Online resources':

```

<additional>
<listBibl type="WRAPPER">
<listBibl type="PRINT">
<head>Printed descriptions:</head>
<bibl>
<title>The Douce Legacy</title> (1984), no.
65</bibl>
<bibl>A. G. Watson, <title>Catalogue of Dated and

manuscrits médiévaux d'oc et
d'oïl</title>
</ref>
</bibl>
</listBibl>
</listBibl>
</additional>
```

- 12 <additional> (additional) groups additional information, combining bibliographic information about a manuscript or other object, or surrogate copies of it, with curatorial or administrative information.
- 13 <recordHist> (recorded history) provides information about the source and revision status of the parent manuscript or object description itself.
- 14 <source> (source) describes the original source for the information contained with a manuscript or object description.
- 15 <availability> (availability) supplies information about the availability of a text, for example any restrictions on its use or distribution, its copyright status, any licence applying to it, etc.
- 16 <custodialHist> (custodial history) contains a description of a manuscript or other object's custodial history, either as running prose or as a series of dated custodial events.
- 17 <surrogates> (surrogates) contains information about any representations of the manuscript or other object being described which may exist in the holding institution or elsewhere.
- 18 <listBibl> (citation list) contains a list of bibliographic citations of any kind.
- 19 <bibl> (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.

Multi-part, composite and similar units.

For multi-part manuscripts or in other cases where a ‘syntactical’ description (Andrist et al., 2013) is required, the <msPart> element should be used. These guidelines recommend the use of <msPart> for:

- manuscripts originally separate, bound together at later dates
- manuscripts with added codicological units
- palimpsest manuscripts
- re-used papyrus
- manuscripts with replacement leaves
- description of endleaves, in cases where a detailed description is required (for short descriptions of endleaves, use <accMat>)

The definition and understanding of composite manuscripts varies between different codicological traditions. The Western tradition has typically understood a composite manuscript to be composed of more than one combined production/usage unit. (For this terminology see Kwakkel 2002).

Manuscripts with separate-but-contemporaneous production units, that were not also at some point separate usage units, are not typically catalogued as composite, although the different production units are usually noted in the description. (For a recent example, see Hanna and Rundle, *Cat. Christ Church MSS.*, MS. 92.)

The use of <msPart> is not recommended for describing added text or decoration where this has been added on the original codicological unit as a supplement to existing text (rather than, as with a palimpsest, as a replacement for that text). In those cases, use of multiple <origDate> and/or <origPlace> elements is recommended; see above.

For composite manuscripts, each codicological unit should be described in a separate <msPart> element using the following elements:

- 20 <msIdentifier> (manuscript identifier) contains the information required to identify the manuscript or similar object being described.
- 21 <msContents> (manuscript contents) describes the intellectual content of a manuscript, manuscript part, or other object either as a series of paragraphs or as a series of structured manuscript items.
- 22 <physDesc> (physical description) contains a full physical description of a manuscript, manuscript part, or other object optionally subdivided using more specialized elements from the model.physDescPart class.
- 23 <history> (history) groups elements describing the full history of a manuscript, manuscript part, or other object.

Endleaves should be described using one or more <msPart> elements following the <msDesc> element which contains the description of the main manuscript.

The element <msFrag> should not be used for this purpose. This element is used for describing manuscripts that have been 'virtually reconstructed' and is not currently used in this project.

Each codicological unit should be labelled using arabic numerals (or according to the convention of the existing catalogue in the case of retroconversion) inside the <idno> in the <altIdentifier> element inside the <msIdentifier> element. The folios comprising the unit should be given.

```
<msPart>
<msIdentifier>
<altIdentifier>
  <idno type="part">Manuscript I = fols 1-134</idno>
</altIdentifier>
</msIdentifier>
</msPart>
```

The data structure of the <msPart> element assumes that codicological units follow one another sequentially in the manuscript, which (in the case of Western manuscripts) is often but not universally true. In cases where one unit is inserted in the middle of another, the description should be organized to deal with each part in sequential order.

May contain	<p>core: <addrLine> <gap> <lb> <name> <note> <pb> <postCode> <street></p> <p>figures: <figure></p> <p>header: <idno></p> <p>namesdates: <addName> <country> <district> <forename> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <fw></p>
Note	This element should be used for postal addresses only. Within it, the generic element <addrLine> may be used as an alternative to any of the more specialized elements available from the <code>model.addrPart</code> class, such as <street>, <postCode> etc.
Example	<p>Using just the elements defined by the core module, an address could be represented as follows:</p> <pre><address> <street>via Marsala 24</street> <postCode>40126</postCode></pre>

	<pre><name>Bologna</name> <name>Italy</name> </address></pre>
Example	When a schema includes the names and dates module more specific elements such as country or settlement would be preferable over generic <name>:
	<pre><address> <street>via Marsala 24</street> <postCode>40126</postCode> <settlement>Bologna</settlement> <country>Italy</country> </address></pre>
Example	<pre><address> <addrLine>Computing Center, MC 135</addrLine> <addrLine>P.O. Box 6998</addrLine> <addrLine>Chicago, IL 60680</addrLine> <addrLine>USA</addrLine> </address></pre>
Example	<pre><address> <country key="FR"/> <settlement type="city">Lyon</settlement> <postCode>69002</postCode> <district type="arrondissement">IIème</district> <district type="quartier">Perrache</district> <street> <num>30</num>, Cours de Verdun</street> </address></pre>
Content model	<pre><content> <sequence> <classRef key="model.global" maxOccurs="unbounded" minOccurs="0"/> <sequence maxOccurs="unbounded" minOccurs="1"> <classRef key="model.addrPart"/> <classRef key="model.global" maxOccurs="unbounded" minOccurs="0"/> </sequence> </sequence> </content></pre>
Schema Declaration	<p>element address</p> <pre>{ att.global.attributes, (model.global*, (model.addrPart, model.global*)+) }</pre>

<adminInfo>

<adminInfo> (administrative information) contains information about the present custody and availability of the

manuscript or other object, and also about the record description itself. [10.9.1. Administrative Information]	
Module	msdescription — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))
Contained by	msdescription: <additional>
May contain	core: <note> header: <availability> msdescription: <custodialHist> <recordHist>
Example	<pre><adminInfo> <recordHist> <source>Record created <date>1 Aug 2004</date> </source> </recordHist> <availability> <p>Until 2015 permission to photocopy some materials from this collection has been limited at the request of the donor. Please ask repository staff for details if you are interested in obtaining photocopies from Series 1: Correspondence.</p> </availability> <custodialHist> <p>Collection donated to the Manuscript Library by the Estate of Edgar Holden in 1993. Donor number: 1993-034.</p> </custodialHist> </adminInfo></pre>
Content model	<content> <sequence> <elementRef key="recordHist" minOccurs="0"/> <elementRef key="availability" minOccurs="0"/> <elementRef key="custodialHist" minOccurs="0"/> <classRef key="model.noteLike" minOccurs="0"/> </sequence> </content>
Schema Declaration	element adminInfo { att.global.attributes, (recordHist?, availability?, custodialHist?, model.noteLike?) }

<altIdentifier>

<altIdentifier> (alternative identifier) contains an alternative or former structured identifier used for a manuscript or other object, such as a former catalogue number. [10.4. The Manuscript Identifier]

Module	msdescription — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@fac)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.typed (@type, @subtype) att.datable (@calendar, @period) (att.datable.w3c (@when, @notBefore, @notAfter, @from, @to)) (att.datable.iso (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso)) (att.datable.custom (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod))

Content model	<pre><content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.gLike"/> <classRef key="model.pPart.transcriptional"/> </alternate> </content></pre>
Schema Declaration	<pre>element am { att.global.attributes, att.typed.attributes, att.editLike.attributes, (text model.gLike model.pPart.transcriptional)* }</pre>

<analytic>

<analytic> (analytic level) contains bibliographic elements describing an item (e.g. an article or poem) published within a monograph or journal and not as an independent publication. [3.12.2.1. Analytic, Monographic, and Series Levels]

Module	core — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))

Contained by	core: <biblStruct>
May contain	core: <author> <date> <editor> <ref> <respStmt> <textLang> <title> header: <availability> <idno>
Note	May contain titles and statements of responsibility (author, editor, or other), in any order. The <analytic> element may only occur within a <biblStruct>, where its use is mandatory for the description of an analytic level bibliographic item.
Example	<biblStruct> <analytic> <author>Chesnutt, David</author> <title>Historical Editions in the States</title> </analytic> <monogr> <title level="j">Computers and the Humanities</title> <imprint> <date when="1991-12">(December, 1991)</date> </imprint> <biblScope>25.6</biblScope> <biblScope>377-380</biblScope> </monogr> </biblStruct>
Content model	<content> <alternate maxOccurs="unbounded" minOccurs="0"> <elementRef key="author"/> <elementRef key="editor"/> <elementRef key="respStmt"/> <elementRef key="title"/> <classRef key="model.ptrLike"/> <elementRef key="date"/> <elementRef key="textLang"/> <elementRef key="idno"/> <elementRef key="availability"/> </alternate> </content>
Schema Declaration	element analytic { att.global.attributes, (author editor respStmt title model.ptrLike date textLang idno availability) }

<author>

<author> (author) in a bibliographic reference, contains the name(s) of an author, personal or corporate, of a work; for example in the same form as that provided by a recognized bibliographic name authority. [[3.12.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement](#)]

Module	core — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facss)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.naming (@role, @nymRef) (att.canonical (@key, @ref)) att.datable (@calendar, @period) (att.datable.w3c (@when, @notBefore, @notAfter, @from, @to)) (att.datable.iso (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso)) (att.datable.custom (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod))
Member of	model.respLike
Contained by	<p>core: <analytic> <bibl> <monogr></p> <p>header: <editionStmt> <titleStmt></p> <p>msdescription: <msItem> <msItemStruct></p>
May contain	<p>core: <abbr> <add> <address> <choice> <cit> <corr> <date> <email> <expan> <foreign> <gap> <graphic> <hi> <lb> <measure> <name> <note> <num> <orig> <pb> <q> <quote> <ref> <reg> <sic> <term> <title> <unclear></p> <p>figures: <figure> <formula></p> <p>header: <idno></p> <p>linking: <seg></p> <p>msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark> <width></p> <p>namesdates: <addName> <country> <district> <forename> <geo> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <am> <damage> <ex> <fw> <subst> <supplied></p> <p>character data</p>
Note	<p>Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use a generally recognized name authority file to supply the content for this element. The attributes @key or @ref may also be used to reference canonical information about the author(s) intended from any appropriate authority, such as a library catalogue or online resource.</p> <p>In the case of a broadcast, use this element for the name of the company or network responsible for making the broadcast.</p> <p>Where an author is unknown or unspecified, this element may contain text such as <i>Unknown</i> or <i>Anonymous</i>. When the appropriate TEI modules are in use, it may also contain detailed tagging of the names used for people, organizations or places, in particular where multiple names are given.</p>
Example	<author>British Broadcasting Corporation</author> <author>La Fayette, Marie Madeleine Pioche de la Vergne, comtesse de (1634–1693)</author> <author>Anonymous</author> <author>Bill and Melinda Gates Foundation</author>

	<pre> <author> <persName>Beaumont, Francis</persName> and <persName>John Fletcher</persName> </author> <author> <orgName key="BBC">British Broadcasting Corporation</orgName>; Radio 3 Network </author> </pre>
Schematron	<pre> <sch:rule context="//tei:msItem//tei:author[ancestor::tei:fileDesc[descendant::tei:idno[@type='catalogue']=('Western')]]> <sch:assert test="@key[matches(., 'person_\d+')]">In the medieval catalogue, the author element, when a child of msItem, must have a key matching the pattern 'person_\d+'.</sch:assert> </sch:rule> </pre>
Content model	<pre> <content> <macroRef key="macro.phraseSeq"/> </content> </pre>
Schema Declaration	<pre> element author { att.global.attributes, att.naming.attributes, att.datable.attributes, macro.phraseSeq} </pre>

<authority>

<authority> (release authority) supplies the name of a person or other agency responsible for making a work available, other than a publisher or distributor. [2.2.4. Publication, Distribution, Licensing, etc.]

Module	header — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.canonical (@key, @ref)
Member of	model.publicationStmtPart.agency
Contained by	core: <monogr> header: <publicationStmt>
May contain	core: <abbr> <address> <choice> <date> <email> <expan> <foreign> <gap> <hi> <lb> <measure> <name> <note> <num> <pb> <q> <ref> <term> <title> figures: <figure> header: <idno> msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark> <width>

<biblScope>

<biblScope> (scope of bibliographic reference) defines the scope of a bibliographic reference, for example as a list of page

	numbers, or a named subdivision of a larger work. [3.12.2.5. Scopes and Ranges in Bibliographic Citations]
Module	core — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facsts)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.citing (@unit, @from, @to)
Member of	model.imprintPart
Contained by	core: <bibl> <imprint> <monogr> <series>
May contain	<p>core: <abbr> <add> <address> <choice> <cit> <corr> <date> <email> <expan> <foreign> <gap> <graphic> <hi> <lb> <measure> <name> <note> <num> <orig> <pb> <q> <quote> <ref> <reg> <sic> <term> <title> <unclear></p> <p>figures: <figure> <formula></p> <p>header: <idno></p> <p>linking: <seg></p> <p>msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark> <width></p> <p>namesdates: <addName> <country> <district> <forename> <geo> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <am> <damage> <ex> <fw> <subst> <supplied></p> <p>character data</p>
Note	<p>When a single page is being cited, use the <code>@from</code> and <code>@to</code> attributes with an identical value. When no clear endpoint is provided, the <code>@from</code> attribute may be used without <code>@to</code>; for example a citation such as ‘p. 3ff’ might be encoded <code><biblScope from="3">p. 3ff</biblScope></code>.</p> <p>It is now considered good practice to supply this element as a sibling (rather than a child) of <code><imprint></code>, since it supplies information which does not constitute part of the imprint.</p>
Example	<pre><biblScope>pp 12–34</biblScope> <biblScope from="12" to="34" unit="page"/> <biblScope unit="volume">II</biblScope> <biblScope unit="page">12</biblScope></pre>

May contain	<p>core: <abbr> <choice> <corr> <expan> <orig> <reg> <sic> <unclear></p> <p>linking: <seg></p> <p>transcr: <am> <ex> <supplied></p>
Note	<p>Because the children of a <choice> element all represent alternative ways of encoding the same sequence, it is natural to think of them as mutually exclusive. However, there may be cases where a full representation of a text requires the alternative encodings to be considered as parallel.</p> <p>Note also that <choice> elements may self-nest.</p> <p>Where the purpose of an encoding is to record multiple witnesses of a single work, rather than to identify multiple possible encoding decisions at a given point, the <app> element and associated elements discussed in section 12.1. The Apparatus Entry, Readings, and Witnesses should be preferred.</p>
Example	An American encoding of <i>Gulliver's Travels</i> which retains the British spelling but also provides a version

	regularized to American spelling might be encoded as follows.
	<p><p>Lastly, That, upon his solemn oath to observe all the above articles, the said man-mountain shall have a daily allowance of meat and drink sufficient for the support of <choice></p> <p><sic>1724</sic></p> <p><corr>1728</corr></p> <p></choice> of our subjects,</p> <p>with free access to our royal person, and other marks of our</p> <p><choice></p> <p><orig>favour</orig></p> <p><reg>favor</reg></p> <p></choice>. </p></p>

May contain	core: <abbr> <add> <address> <bibl> <biblStruct> <choice> <cit> <corr> <date> <desc> <email> <expan> <foreign> <gap> <graphic> <hi> <i> <label> <lb> <lg> <list> <listBibl> <measure> <name> <note> <num> <orig> <p> <pb> <q> <quote> <ref> <reg> <sic> <term> <title> <unclear> figures: <figure> <formula> header: <idno> linking: <seg> msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <msDesc> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark> <width> namesdates: <addName> <country> <district> <forename> <geo> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname> transcr: <am> <damage> <ex> <fw> <subst> <supplied> character data
Example	condition <p>There are lacunae in three places in this manuscript. After 14v two leaves has been cut out and narrow strips leaves remains in the spine. After 68v one gathering is missing and after 101v at least one gathering of 8 leaves has been lost. </p> <p>Several leaves are damaged with tears or holes or have a irregular shape. Some of the damages do not allow the lines to be of full length and they are apparently older than the script. There are tears on fol. 2r-v, 9r-v, 10r-v, 15r-18v, 19r-v, 20r-22v, 23r-v, 24r-28v, 30r-v, 32r-35v, 37r-v, 38r-v, 40r-43v, 45r-47v, 49r-v, 51r-v, 53r-60v, 67r-v, 68r-v, 70r-v, 74r-80v, 82r-v, 86r-v, 88r-v, 89r-v, 95r-v, 97r-98v 99r-v, 100r-v. On fol. 98 the corner has been torn off. Several leaves are in a bad condition due to moist and wear, and have become dark, bleached or wrinkled. </p> <p>The script has been touched up in the 17th century with black ink. The touching up on the following fol. was done by <name>Bishop Brynjólf Sveinsson</name>: 1v, 3r, 4r, 5r, 6v, 8v, 9r, 10r, 14r, 14v, 22r, 30v, 36r-52v, 72v, 77r, 78r, 103r, 104r. An AM-note says according to the lawman <name>Sigurður Björnsson</name> that the rest of the touching up was done by himself and another lawman

	<pre> <name>Sigurður Jónsson</name>. <name>Sigurður Björnsson</name> did the touching up on the following fols.: 46v, 47r, 48r, 49r-v, 50r, 52r-v. <name>Sigurður Jónsson</name> did the rest of the touching up in the section 36r-59r containing <title>Bretasögur</title> </p> </condition></pre>
Content model	<content> <macroRef key="macro.specialPara"/> </content>

May contain	<p>core: <abbr> <add> <address> <bibl> <biblStruct> <choice> <cit> <corr> <date> <desc> <email> <expan> <foreign> <gap> <graphic> <hi> <i> <label> <lb> <lg> <list> <listBibl> <measure> <name> <note> <num> <orig> <pb> <q> <quote> <ref> <reg> <sic> <term> <title> <unclear></p> <p>figures: <figure> <formula></p> <p>header: <idno></p> <p>linking: <seg></p> <p>msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <msDesc> <objectType> <origDate> <origPlace></p>

	<pre><secFol> <signatures> <stamp> <watermark> <width> namesdates: <addName> <country> <district> <forename> <geo> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname> transcr: <am> <damage> <ex> <fw> <subst> <supplied> character data</pre>
Note	<p>This element should be used for deletion of shorter sequences of text, typically single words or phrases. The <code><delSpan></code> element should be used for longer sequences of text, for those containing structural subdivisions, and for those containing overlapping additions and deletions.</p> <p>The text deleted must be at least partially legible in order for the encoder to be able to transcribe it (unless it is restored in a <code><supplied></code> tag). Illegible or lost text within a deletion may be marked using the <code><gap></code> tag to signal that text is present but has not been transcribed, or is no longer visible. Attributes on the <code><gap></code> element may be used to indicate how much text is omitted, the reason for omitting it, etc. If text is not fully legible, the <code><unclear></code> element (available when using the additional tagset for transcription of primary sources) should be used to signal the areas of text which cannot be read with confidence in a similar way.</p> <p>Degrees of uncertainty over what can still be read, or whether a deletion was intended may be indicated by use of the <code><certainty></code> element (see 21. Certainty, Precision, and Responsibility).</p> <p>There is a clear distinction in the TEI between <code></code> and <code><surplus></code> on the one hand and <code><gap></code> or <code><unclear></code> on the other. <code></code> indicates a deletion present in the source being transcribed, which states the author's or a later scribe's intent to cancel or remove text. <code><surplus></code> indicates material present in the source being transcribed which should have been so deleted, but which is not in fact. <code><gap></code> or <code><unclear></code>, by contrast, signal an editor's or encoder's decision to omit something or their inability to read the source text. See sections 11.3.1.7. Text Omitted from or Supplied in the Transcription and 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for the relationship between these and other related elements used in detailed transcription.</p>

	<p>derived-module-msdesc: <countermark></p> <p>figures: <figDesc></p> <p>header: <authority> <catDesc> <change> <distributor> <edition> <extent> <funder> <handNote> <licence> <principal> <scriptNote> <sponsor></p> <p>linking: <seg></p> <p>msdescription: <accMat> <acquisition> <additions> <catchwords> <collation> <collection> <colophon> <condition> <custEvent> <decoNote> <explicit> <filiation> <finalRubric> <foliation> <heraldry> <incipit> <institution> <layout> <material> <musicNotation> <objectType> <origDate> <origPlace> <origin> <provenance> <repository> <r rubric> <secFol> <signatures> <source> <stamp> <summary> <support> <surrogates> <typeNote> <watermark></p> <p>namesdates: <addName> <country> <district> <forename> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <damage> <fw> <supplied></p>
May contain	msdescription: <depth> <dim> <height> <width>
Note	Contains no more than one of each of the specialized elements used to express a three-dimensional object's height, width, and depth, combined with any number of other kinds of dimensional specification.
Example	<pre><dimensions type="leaves"> <height scope="range">157-160</height> <width>105</width> </dimensions> <dimensions type="ruled"> <height scope="most">90</height> <width scope="most">48</width> </dimensions> <dimensions unit="in"> <height>12</height> <width>10</width> </dimensions></pre>
Example	<p>This element may be used to record the dimensions of any text-bearing object, not necessarily a codex. For example:</p> <pre><dimensions type="panels"> <height scope="all">7004</height> <width scope="all">1803</width> <dim type="relief" unit="mm">345</dim> </dimensions></pre> <p>This might be used to show that the inscribed panels on some (imaginary) monument are all the same size (7004 by 1803 cm) and stand out from the rest of the monument by 345 mm.</p>

Example	When simple numeric quantities are involved, they may be expressed on the <code>@quantity</code> attribute of any or all of the child elements, as in the following example:
	<pre><dimensions type="leaves"> <height scope="range">157-160</height> <width quantity="105"/> </dimensions> <dimensions type="ruled"> <height quantity="90" scope="most" unit="cm"/> <width quantity="48" scope="most" unit="cm"/> </dimensions> <dimensions unit="in"> <height quantity="12"/> <width quantity="10"/> </dimensions></pre>
Schematron	<pre><sch:rule context="//tei:dimensions"> <sch:assert role="error" test="@unit"> The unit of measurement must be specified in the unit attribute on the dimensions element </sch:assert> </sch:rule></pre>
Schematron	<pre><sch:report test="count(tei:width)> 1">The element <sch:name/> may appear once only </sch:report> <sch:report test="count(tei:height)> 1">The element <sch:name/> may appear once only </sch:report> <sch:report test="count(tei:depth)> 1">The element <sch:name/> may appear once only </sch:report></pre>
Content model	<pre><content> <alternate maxOccurs="unbounded" minOccurs="0"> <elementRef key="dim"/> <classRef key="model.dimLike"/> </alternate> </content></pre>
Schema Declaration	<pre>element dimensions { att.global.attributes, att.dimensions.attributes, att.typed.attribute.subtype, attribute type { "binding" "folia" "leaf" "line-height" "ruled" "written" "other" }?, (dim model.dimLike)* }</pre>

<figDesc>

<figDesc> (description of figure) contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it. [14.4. Specific Elements for Graphic Images]

Module	figures — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facss)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))
Contained by	figures: <figure>
May contain	<p>core: <abbr> <address> <bibl> <biblStruct> <choice> <cit> <date> <desc> <email> <expan> <foreign> <hi> <label> <list> <listBibl> <measure> <name> <num> <q> <quote> <ref> <term> <title></p> <p>header: <idno></p> <p>msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <msDesc> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark> <width></p> <p>namesdates: <addName> <country> <district> <forename> <geo> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <am> <ex> <subst></p> <p>character data</p>
Note	This element is intended for use as an alternative to the content of its parent <figure> element ; for example, to display when the image is required but the equipment in use cannot display graphic images. It may also be used for indexing or documentary purposes.
Example	<pre><figure> <graphic url="emblem1.png"/> <head>Emblemi d'Amore</head> <figDesc>A pair of naked winged cupids, each holding a flaming torch, in a rural setting.</figDesc> </figure></pre>
Content model	<content> <macroRef key="macro.limitedContent"/> </content>
Schema Declaration	element figDesc { att.global.attributes, macro.limitedContent }

<figure>

<figure> (figure) groups elements representing or containing graphic information such as an illustration, formula, or figure.

<fileDesc>

<fileDesc> (file description) contains a full bibliographic description of an electronic file. [2.2. The File Description 2.1.1. The TEI Header and Its Components]

Module	header — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))
Contained by	header: <teiHeader>
May contain	header: <editionStmt> <extent> <publicationStmt> <sourceDesc> <titleStmt>
Note	The major source of information for those seeking to create a catalogue entry or bibliographic citation for an electronic file. As such, it provides a title and statements of responsibility together with details of the publication or distribution of the file, of any series to which it belongs, and detailed bibliographic notes for matters not addressed elsewhere in the header. It also contains a full bibliographic description for the source or sources from which the electronic text was derived.
Example	<fileDesc>

	<pre> <titleStmt> <title>The shortest possible TEI document</title> </titleStmt> <publicationStmt> <p>Distributed as part of TEI P5</p> </publicationStmt> <sourceDesc> <p>No print source exists: this is an original digital text</p> </sourceDesc> </fileDesc> </pre>
Content model	<pre> <content> <sequence> <sequence> <elementRef key="titleStmt"/> <elementRef key="editionStmt" minOccurs="0"/> <elementRef key="extent" minOccurs="0"/> <elementRef key="publicationStmt"/> <elementRef key="seriesStmt" maxOccurs="unbounded" minOccurs="0"/> <elementRef key="notesStmt" minOccurs="0"/> </sequence> <elementRef key="sourceDesc" maxOccurs="unbounded" minOccurs="1"/> </sequence> </content> </pre>
Schema Declaration	<pre> element fileDesc { att.global.attributes, ((titleStmt, editionStmt?, extent?, publicationStmt, seriesStmt*, notesStmt?), sourceDesc+) } </pre>

<filiation>

<filiation> (filiation) contains information concerning the manuscript or other object's filiation, i.e. its relationship to other surviving manuscripts or other objects of the same text or contents, its photographs, antigraphs and apographs. [10.6.1. [The msItem and msItemStruct Elements](#)]

Module	msdescription — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.typed (@type, @subtype)
Member of	model.msItemPart
Contained by	msdescription: <msItem> <msItemStruct>
May contain	<p>core: <abbr> <add> <address> <bibl> <biblStruct> <choice> <cit> <corr> <date> <desc> <email> <expan> <foreign> <gap> <graphic> <hi> <l> <label> <lb> <lg> <list> <listBibl> <measure> <name> <note> <num> <orig> <p> <pb> <q> <quote> <ref> <reg> <sic> <term> <title> <unclear></p> <p>figures: <figure> <formula></p> <p>header: <idno></p> <p>linking: <seg></p> <p>msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <msDesc> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark> <width></p> <p>namesdates: <addName> <country> <district> <forename> <geo> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <am> <damage> <ex> <fw> <subst> <supplied></p> <p>character data</p>
Example	<pre><msContents> <msItem> <title>Beljakovski sbornik</title> <filiation type="photograph">Bulgarian</filiation> <filiation type="antigraph">Middle Bulgarian</filiation> <filiation type="apograph"> <ref target="#DN17">Dujchev N 17</ref> </filiation> </msItem> </msContents> <!-- ... --&gt; &lt;msDesc xml:id="DN17"&gt; &lt;msIdentifier&gt; &lt;settlement&gt;Faraway&lt;/settlement&gt; &lt;/msIdentifier&gt; <!-- ... --&gt; &lt;/msDesc&gt;</pre> </pre>

	In this example, the reference to 'Dujchev N17' includes a link to some other manuscript description which has the identifier DN17.
Example	<pre><msItem> <title>Guan-ben</title> <filiation> <p>The "Guan-ben" was widely current among mathematicians in the Qing dynasty, and "Zhao Qimei version" was also read. It is therefore difficult to know the correct filiation path to follow. The study of this era is much indebted to Li Di. We explain the outline of his conclusion here. Kong Guangsen (1752-1786)(17) was from the same town as Dai Zhen, so he obtained "Guan-ben" from him and studied it(18). Li Huang (d. 1811) (19) took part in editing Si Ku Quan Shu, so he must have had "Guan-ben". Then Zhang Dunren (1754-1834) obtained this version, and studied "Da Yan Zong Shu Shu" (The General Dayan Computation). He wrote Jiu Yi Suan Shu (Mathematics Searching for One, 1803) based on this version of Shu Xue Jiu Zhang (20).</p> <p>One of the most important persons in restoring our knowledge concerning the filiation of these books was Li Rui (1768(21) -1817)(see his biography). ... only two volumes remain of this manuscript, as far as chapter 6 (chapter 3 part 2) p.13, that is, question 2 of "Huan Tian San Ji" (square of three loops), which later has been lost.</p> </filiation> </msItem> <!--http://www2.nkfust.edu.tw/~jochi/ed1.htm--></pre>
Content model	<content> <macroRef key="macro.specialPara"/> </content>
Schema Declaration	element filiation { att.global.attributes, att.typed.attributes, macro.specialPara}

<finalRubric>

<finalRubric> (final rubric) contains the string of words that denotes the end of a text division, often with an assertion as to its author and title, usually set off from the text itself by red ink, by a different size or type of script, or by some other such visual device. [10.6.1. The msItem and msItemStruct Elements]

Derived from	att.handFeatures								
Status	Optional								
Datatype	1–∞ occurrences of teidata.name separated by whitespace								
Suggested values include:	<p>capitalisSquare The script of the hand is square capitals</p> <p>capitalisRustic The script of the hand is rustic capitals</p> <p>uncial The script of the hand is uncial</p> <p>halfUncial The script of the hand is half uncial</p> <p>minusculeInsular The script of the hand is insular minuscule</p> <p>minusculeVernacular The script of the hand is English vernacular minuscule ('Anglo-Saxon minuscule')</p>								

	minusculeCaroline The script of the hand is Caroline minuscule (English and continental variants of the script)
	minuscule The script of the hand is an unspecific minuscule (not Caroline, insular, or English vernacular)
	protogothic The script of the hand is protogothic (Romanesque, praegothica)
	textualisNorthern The script of the hand is Northern textualis
	textualisSouthern The script of the hand is Southern textualis
	semitextualis The script of the hand is semi textualis
	cursivaAntiquior The script of the hand is cursiva antiquior (anglicana, 'Ältere gotische Kursive')
	cursiva The script of the hand is cursiva ('cancelleresca', 'bastarda', 'lettre batarde', 'secretary', etc.)
	hybrida The script of the hand is cursiva ('semihybrida', 'loopless bastarda', 'fractura', 'mercantesca', etc.)
	gothicoAntiqua The script of the hand is gothic-antiqua ('fere-humanistica', 'gothico-humanistica')
	humanistica The script of the hand is humanistic (unspecified)
	humanisticaTextualis The script of the hand is humanistic textualis (unspecified)
	humanisticaSemitextualis The script of the hand is humanistic semitextualis
	humanisticaCursiva The script of the hand is humanistic cursive
execution	Specifies the execution of the script according to a widely-used schema, where applicable. The default value is assumed to be libraria. Note: This is a customization which is not currently part of the TEI P5 standard.
Status	Optional
Datatype	teidata.word
Suggested values include:	formata Execution is calligraphic.
	libraria A normal level of execution.

	currens Execution is informal.

Note	The <head> element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a <head> element based on its structural position. A <head> occurring as the first element of a list is the title of that list; one occurring as the first element of a <div1> is the title of that chapter or section.
Example	<p>The most common use for the <head> element is to mark the headings of sections. In older writings, the headings or incipits may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a <trailer>, as in this example:</p> <pre><div1 n="I" type="book"> <head>In the name of Christ here begins the first book of the ecclesiastical history of Georgius Florentinus, known as Gregory, Bishop of Tours.</head> <div2 type="section"> <head>In the name of Christ here begins Book I of the history.</head> <p>Proposing as I do ...</p> <p>From the Passion of our Lord until the death of Saint Martin four hundred and twelve years passed.</p> <trailer>Here ends the first Book, which covers five thousand, five hundred and ninety-six years from the beginning of the world down to the death of Saint Martin.</trailer> </div2> </div1></pre>
Example	<p>When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the @place attribute.</p> <pre><div type="subsection"> <head place="margin">Secunda conclusio</head> <p> <lb n="1251"/> <hi rend="large">Potencia: habitus: et actus: recipiunt speciem ab obiectis<supplied>.</supplied> </hi></pre>

	<pre><lb n="1252"/>Probatur sic. Omne importans necessarium habitudinem ad proprium [...] </p> </div></pre>
Example	<p>The <code><head></code> element is also used to mark headings of other units, such as lists:</p> <p>With a few exceptions, connectives are equally useful in all kinds of discourse: description, narration, exposition, argument.</p> <pre><list rend="bulleted"> <head>Connectives</head> <item>above</item> <item>accordingly</item> <item>across from</item> <item>adjacent to</item> <item>again</item> <item> <!-- ... --> </item> </list></pre>
Content model	<pre><content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <elementRef key="lg"/> <classRef key="model.gLike"/> <classRef key="model.phrase"/> <classRef key="model.inter"/> <classRef key="model.lLike"/> <classRef key="model.global"/> </alternate> </content></pre>
Schema Declaration	<pre>element head { att.global.attributes, att.typed.attributes, att.placement.attributes, att.written.attributes, (text lg model.gLike model.phrase model.inter model.lLike model.global) * }</pre>

<item> (item) contains one component of a list. [3.8. Lists 2.6. The Revision Description]

Module	core — 0
Attributes	<pre> att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.sortable (@sortKey)</pre>
Contained by	core: <list>
May contain	<p>core: <abbr> <add> <address> <bibl> <biblStruct> <choice> <cit> <corr> <date> <desc> <email> <expan> <foreign> <gap> <graphic> <hi> <i> <label> <lb> <lg> <list> <listBibl> <measure> <name> <note> <num> <orig> <p> <pb> <q> <quote> <ref> <reg> <sic> <term> <title> <unclear></p> <p>figures: <figure> <formula></p> <p>header: <idno></p> <p>linking: <seg></p> <p>msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <msDesc> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark> <width></p> <p>namesdates: <addName> <country> <district> <forename> <geo> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <am> <damage> <ex> <fw> <subst> <supplied></p> <p>character data</p>

Note	<p>May contain simple prose or a sequence of chunks.</p> <p>Whatever string of characters is used to label a list item in the copy text may be used as the value of the global @n attribute, but it is not required that numbering be recorded explicitly. In ordered lists, the @n attribute on the <item> element is by definition synonymous with the use of the <label> element to record the enumerator of the list item. In glossary lists, however, the term being defined should be given with the <label> element, not @n.</p>
Example	<pre><list rend="numbered"> <head>Here begin the chapter headings of Book IV</head> <item n="4.1">The death of Queen Clotild.</item> <item n="4.2">How King Lothar wanted to appropriate one third of the Church revenues.</item> <item n="4.3">The wives and children of Lothar.</item> <item n="4.4">The Counts of the Bretons.</item> <item n="4.5">Saint Gall the Bishop.</item> <item n="4.6">The priest Cato.</item> <item> ...</item> </list></pre>
Content model	<content> <macroRef key="macro.specialPara"/> </content>
Schema Declaration	element item { att.global.attributes, att.sortable.attributes, macro.specialPara}

<keywords>

<keywords> (keywords) contains a list of keywords or phrases identifying the topic or nature of a text. [2.4.3. The Text Classification]

Module	header — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.links (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) scheme identifies the controlled vocabulary within which the set of keywords concerned is defined, for example by a <taxonomy> element, or by some other resource. Status Optional Datatype teidata.pointer
Contained by	header: <textClass>
May contain	core: <list> <term>
Note	<p>Each individual keyword (including compound subject headings) should be supplied as a <term> element directly within the <keywords> element. An alternative usage, in which each <term> appears within an <item> inside a <list> is permitted for backwards compatibility, but is deprecated.</p> <p>If no control list exists for the keywords used, then no value should be supplied for the @scheme attribute.</p>
Example	<keywords scheme="http://classificationweb.net"> <term>Babbage, Charles</term> <term>Mathematicians - Great Britain - Biography</term>

	</keywords>
Example	<pre> <keywords> <term>Fermented beverages</term> <term>Central Andes</term> <term>Schinus molle</term> <term>Molle beer</term> <term>Indigenous peoples</term> <term>Ethnography</term> <term>Archaeology</term> </keywords> </pre>

Example	Labels are commonly used for the headwords in glossary lists; note the use of the global @xml:lang

	<p>attribute to set the default language of the glossary list to Middle English, and identify the glosses and headings as modern English or Latin:</p> <pre><list type="gloss" xml:lang="enm"> <head xml:lang="en">Vocabulary</head> <headLabel xml:lang="en">Middle English</headLabel> <headItem xml:lang="en">New English</headItem> <label>nu</label> <item xml:lang="en">now</item> <label>lhude</label> <item xml:lang="en">loudly</item> <label>bloweth</label> <item xml:lang="en">blooms</item> <label>med</label> <item xml:lang="en">meadow</item> <label>wude</label> <item xml:lang="en">wood</item> <label>awe</label> <item xml:lang="en">ewe</item> <label>lhouth</label> <item xml:lang="en">lows</item> <label>sterteth</label> <item xml:lang="en">bounds, frisks (cf. <cit> <ref>Chaucer, K.T.644</ref> <quote>a courser, <term>sterting</term>as the fyr</quote> </cit> </item> <label>verteth</label> <item xml:lang="la">pedit</item> <label>murie</label> <item xml:lang="en">merrily</item> <label>swik</label> <item xml:lang="en">cease</item> <label>naver</label> <item xml:lang="en">never</item> </list></pre>
Example	<p>Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon's <i>Autobiography</i>. In this usage the <code><label></code> element is synonymous with the <code>@n</code> attribute on the <code><item></code> element:</p> <pre>I will add two facts, which have seldom occurred in the composition of six, or at least of five quartos. <list rend="runon" type="ordered"> <label>(1)</label> <item>My first rough manuscript, without any intermediate copy, has been sent to the press.</item> <label>(2) </label> <item>Not a sheet has been seen by any human eyes, excepting those of the author and the printer: the faults and the merits are exclusively my own.</item> </list></pre>
Example	<p>Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:</p>

	<pre> <list type="gloss"> <label>March 1757.</label> <item>I wrote some critical observations upon Plautus.</item> <label>March 8th.</label> <item>I wrote a long dissertation upon some lines of Virgil.</item> <label>June.</label> <item>I saw Mademoiselle Curchod — <quote xml:lang="la">Omnia vincit amor, et nos cedamus amori.</quote> </item> <label>August.</label> <item>I went to Crassy, and staid two days.</item> </list></pre>
	<p>Note that the <code><label></code> might also appear within the <code><item></code> rather than as its sibling. Though syntactically valid, this usage is not recommended TEI practice.</p>
Example	<p>Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the <code><label></code> element appears <i>within</i> the <code><p></code> or <code><lg></code> element, rather than as a preceding sibling of it.</p>
	<pre> <p>[...] <lb/>& n'entrer en mauuais & mal-heu- <lb/>ré mefnage. Or des que le confente- <lb/>ment des parties y est le mariage est <lb/>arresté, quoy que de fait il ne soit <label place="margin">Puissance maritale entre les Romains.</label> <lb/> confommé. Depuis la confomma- <lb/>tion du mariage la femme est soub <lb/> la puissance du mary, s'il n'est escla- <lb/>ue ou enfant de famille : car en ce <lb/> cas, la femme, qui a espousé vn en- <lb/>fant de famille, est sous la puissance [...]</p></pre>
	<p>In this example the text of the label appears in the right hand margin of the original source, next to the paragraph it describes, but approximately in the middle of it. If so desired the <code>@type</code> attribute may be used to distinguish different categories of label.</p>
Content model	<pre> <content> <macroRef key="macro.phraseSeq"/> </content></pre>

May contain	Empty element
Note	<p>By convention, <lb> elements should appear at the point in the text where a new line starts. The @n attribute, if used, indicates the number or other value associated with the text between this point and the next <lb> element, typically the sequence number of the line within the page, or other appropriate unit. This element is intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the <l> element is available) except in circumstances where structural units cannot otherwise be marked.</p> <p>The @type attribute may be used to characterize the line break in any respect. The more specialized attributes @break, @ed, or @edRef should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.</p>
Example	<p>This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:</p> <pre><1>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit</1> <1>Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</1> <1>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe,</1></pre>
Example	<p>This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The @break attribute is used to show that the line break does not (as elsewhere) mark the start of a new word.</p> <pre><titlePart> <lb/>With Additions, ne-<lb break="no"/>ver before Printed.</pre>

	</titlePart>
Content model	<content> <empty/> </content>
Schema Declaration	element lb { att.global.attributes, att.typed.attributes, att.edition.attributes, att.spanning.attributes, att.breaking.attributes, empty }

<lg>

<lg> (line group) contains one or more verse lines functioning as a formal unit, e.g. a stanza, refrain, verse paragraph, etc.

Content model	<pre><content> <macroRef key="macro.specialPara"/> </content></pre>
Schema Declaration	<pre>element licence { att.global.attributes, att.pointing.attributes, att.datable.attributes, macro.specialPara}</pre>

<list>

<list> (list) contains any sequence of items organized as a list. [3.8. Lists]

Module	core — 0								
Attributes	<p>att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.sortable (@sortKey) att.typed (type, @subtype)</p> <p>type (type) describes the nature of the items in the list.</p> <table> <tr> <td>Derived from</td> <td>att.typed</td> </tr> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.enumerated</td> </tr> <tr> <td>Suggested values include:</td> <td>gloss (gloss) each list item glosses some term or concept, which is given by a <label> element preceding the list item.</td> </tr> </table>	Derived from	att.typed	Status	Optional	Datatype	teidata.enumerated	Suggested values include:	gloss (gloss) each list item glosses some term or concept, which is given by a <label> element preceding the list item.
Derived from	att.typed								
Status	Optional								
Datatype	teidata.enumerated								
Suggested values include:	gloss (gloss) each list item glosses some term or concept, which is given by a <label> element preceding the list item.								

	<p>index (index) each list item is an entry in an index such as the alphabetical topical index at the back of a print volume.</p> <p>instructions (instructions) each list item is a step in a sequence of instructions, as in a recipe.</p> <p>litany (litany) each list item is one of a sequence of petitions, supplications or invocations, typically in a religious ritual.</p> <p>syllogism (syllogism) each list item is part of an argument consisting of two or more propositions and a final conclusion derived from them.</p> <p>Note Previous versions of these Guidelines recommended the use of @type on <list> to encode the rendering or appearance of a list (whether it was bulleted, numbered, etc.). The current recommendation is to use the @rend or @style attributes for these aspects of a list, while using @type for the more appropriate task of characterizing the nature of the content of a list.</p> <p>The formal syntax of the element declarations allows <label> tags to be omitted from lists tagged <list type="gloss">; this is however a semantic error.</p>
Member of	model.listLike
Contained by	<p>core: <add> <corr> <desc> <head> <hi> <item> <l> <note> <orig> <p> <q> <quote> <ref> <reg> <sic> <textLang> <title> <unclear></p> <p>figures: <figDesc> <figure></p> <p>header: <change> <handNote> <keywords> <licence> <revisionDesc> <scriptNote> <sourceDesc></p> <p>linking: <seg></p> <p>msdescription: <accMat> <acquisition> <additions> <collation> <condition> <custEvent> <decoNote> <filiation> <foliation> <layout> <musicNotation> <origin> <provenance> <signatures> <source> <summary> <support> <surrogates> <typeNote></p> <p>textstructure: <body> <div></p> <p>transcr: <damage> <supplied></p>
May contain	<p>core: <desc> <gap> <head> <item> <label> <lb> <note> <pb></p> <p>figures: <figure></p> <p>transcr: <fw></p>
Note	May contain an optional heading followed by a series of items, or a series of label and item pairs, the latter being optionally preceded by one or two specialized headings.
Example	<list rend="numbered"> <item>a butcher</item>

	<pre><item>a baker</item> <item>a candlestick maker, with <list rend="bulleted"> <item>rings on his fingers</item> <item>bells on his toes</item> </list> </item> </list></pre>
Example	<pre><list rend="bulleted" type="syllogism"> <item>All Cretans are liars.</item> <item>Epimenides is a Cretan.</item> <item>ERGO Epimenides is a liar.</item> </list></pre>
Example	<pre><list rend="simple" type="litany"> <item>God save us from drought.</item> <item>God save us from pestilence.</item> <item>God save us from wickedness in high places.</item> <item>Praise be to God.</item> </list></pre>
Example	<p>The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):</p> <pre><div1 type="section"> <head>Athelstan's Ordinance</head> <list rend="numbered"> <item n="1">Concerning thieves. First, that no thief is to be spared who is caught with the stolen goods, [if he is] over twelve years and [if the value of the goods is] over eightpence. <list rend="numbered"> <item n="1.1">And if anyone does spare one, he is to pay for the thief with his wergild — and the thief is to be no nearer a settlement on that account — or to clear himself by an oath of that amount.</item> <item n="1.2">If, however, he [the thief] wishes to defend himself or to escape, he is not to be spared [whether younger or older than twelve].</item> <item n="1.3">If a thief is put into prison, he is to be in prison 40 days, and he may then be redeemed with 120 shillings; and the kindred are to stand surety for him that he will desist for ever.</item> <item n="1.4">And if he steals after that, they are to pay for him with his wergild, or to bring him back there.</item> <item n="1.5">And if he steals after that, they are to pay for him with his wergild, whether to the king or to him to whom it rightly belongs; and everyone of those who supported him is to pay 120 shillings to the king as a fine.</item> </list> </item> <item n="2">Concerning lordless men. And we pronounced about these lordless men, from whom no justice can be obtained, that one should order their kindred to fetch back such a person to justice and to find him a lord in public meeting. <list rend="numbered"> <item n="2.1">And if they then will not, or cannot, produce him on that appointed day, he is then to be a fugitive afterwards, and he who encounters him is to strike him</pre>

	<p>down as a thief.</item></p> <p><item n="2.2">And he who harbours him after that, is to pay for him with his wergild or to clear himself by an oath of that amount.</item></p> <p></list></p> <p></item></p> <p><item n="3">Concerning the refusal of justice. The lord who refuses justice and upholds his guilty man, so that the king is appealed to, is to repay the value of the goods and 120 shillings to the king; and he who appeals to the king before he demands justice as often as he ought, is to pay the same fine as the other would have done, if he had refused him justice.</p> <p><list rend="numbered"></p> <p><item n="3.1">And the lord who is an accessory to a theft by his slave, and it becomes known about him, is to forfeit the slave and be liable to his wergild on the first occasion if he does it more often, he is to be liable to pay all that he owns.</item></p> <p><item n="3.2">And likewise any of the king's treasurers or of our reeves, who has been an accessory of thieves who have committed theft, is to liable to the same.</item></p> <p></list></p> <p></item></p> <p><item n="4">Concerning treachery to a lord. And we have pronounced concerning treachery to a lord, that he [who is accused] is to forfeit his life if he cannot deny it or is afterwards convicted at the three-fold ordeal.</item></p> <p></list></p> <p></div1></p>
	<p>Note that nested lists have been used so the tagging mirrors the structure indicated by the two-level numbering of the clauses. The clauses could have been treated as a one-level list with irregular numbering, if desired.</p>
Example	<p><p>These decrees, most blessed Pope Hadrian, we propounded in the public council ... and they confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards inscribed with a careful pen on the paper of this page, affixing thus the sign of the Holy Cross.</p> <p><list rend="simple"></p> <p><item>I, Eanbald, by the grace of God archbishop of the holy church of York, have subscribed to the pious and catholic validity of this document with the sign of the Holy Cross.</item></p> <p><item>I, Ælfwold, king of the people across the Humber, consenting have subscribed with the sign of the Holy Cross.</item></p> <p><item>I, Tilberht, prelate of the church of Hexham, rejoicing have subscribed with the sign of the Holy Cross.</item></p> <p><item>I, Higbald, bishop of the church of Lindisfarne, obeying have subscribed with the sign of the Holy Cross.</item></p> <p><item>I, Ethelbert, bishop of Candida Casa, suppliant, have subscribed with the sign of the Holy Cross.</item></p> <p><item>I, Ealdwulf, bishop of the church of Mayo, have subscribed with devout will.</item></p> <p><item>I, Æthelwine, bishop, have subscribed through delegates.</item></p> <p><item>I, Sicga, patrician, have subscribed with serene mind with the sign of the Holy Cross.</item></p> <p></list></p> <p></p></p>

	<pre><handNote> <licence> <principal> <scriptNote> <sponsor> linking: <seg> msdescription: <accMat> <acquisition> <additions> <catchwords> <collation> <collection> <colophon> <condition> <custEvent> <decoNote> <explicit> <filiation> <finalRubric> <foliation> <heraldry> <incipit> <institution> <layout> <locusGrp> <material> <msItem> <msItemStruct> <musicNotation> <objectType> <origDate> <origPlace> <origin> <provenance> <repository> <r rubric> <secFol> <signatures> <source> <stamp> <summary> <support> <surrogates> <typeNote> <watermark> namesdates: <addName> <country> <district> <forename> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname> transcr: <damage> <fw> <supplied></pre>
May contain	<p>core: <hi> <q></p> <p>character data</p>
Note	<p>The <code>@target</code> attribute should only be used to point to elements that contain or indicate a transcription of the locus being described, as in the ‘Ben Jonson’ example.</p> <p>To associate a <code><locus></code> element with a page image or other comparable representation, the global <code>@facs</code> attribute should be used, as shown in the ‘Birds Praise of Love’ example. The <code>@facs</code> attribute may be used to indicate one or more image files, as in that example, or alternatively it may point to one or more appropriate XML elements, such as the <code><surface></code>, <code><zone></code>, <code><graphic></code>, or <code><binaryObject></code> elements.</p> <p>When a single page is being cited, use the <code>@from</code> and <code>@to</code> attributes with an identical value. When no clear endpoint is provided, the <code>@from</code> attribute may be used without <code>@to</code>; for example a citation such as ‘p. 3ff’ might be encoded <code><locus from="3">p. 3ff</locus></code>.</p>
Example	<pre><!-- within ms description --><msItem n="1"> <locus from="1r" target="#F1r #F1v #F2r" to="2r">ff. 1r-2r</locus> <author>Ben Jonson</author> <title>Ode to himself</title> <r rubric rend="italics"> An Ode<lb/> to him selfe.</r rubric> <incipit>Com leaue the loathed stage</incipit> <explicit>And see his chariot triumph ore his wayne.</explicit> <bibl> <name>Beal</name>, <title>Index 1450-1625</title>, JnB 380</bibl> </msItem> <!-- within transcription ... --> <pb xml:id="F1r"/> <!-- ... --> <pb xml:id="F1v"/> <!-- ... --> <pb xml:id="F2r"/> <!-- ... --></pre>
Example	The <code>@facs</code> attribute is available globally when the <code>transcr</code> module is included in a schema. It may be used to point directly to an image file, as in the following example:

	<pre> <msItem> <locus facets="images/08v.jpg images/09r.jpg images/09v.jpg images/10r.jpg images/10v.jpg">fol. 8v-10v</locus> <title>Birds Praise of Love</title> <bibl> <title>IMEV</title> <biblScope>1506</biblScope> </bibl> </msItem></pre>
Content model	<pre> <content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.gLike"/> <classRef key="model.hiLike"/> </alternate> </content></pre>
Schema Declaration	<pre> element locus { att.global.attributes, att.pointing.attributes, att.typed.attributes, attribute scheme { text }?, attribute from { text }?, attribute to { text }?, (text model.gLike model.hiLike)* }</pre>

<locusGrp>

<locusGrp> (locus group) groups a number of locations which together form a distinct but discontinuous item within a manuscript, manuscript part, or other object. [10.3.5. References to Locations within a Manuscript]

Module	msdescription — 0
Attributes	<p>att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facets (@facets)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))</p> <p>scheme (scheme) identifies the foliation scheme in terms of which all the locations contained by the group are specified by pointing to some <foliation> element defining it, or to some other equivalent resource.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p>

May contain	<p>core: <abbr> <add> <address> <bibl> <biblStruct> <choice> <cit> <corr> <date> <desc> <email> <expan> <foreign> <gap> <graphic> <hi> <l> <label> <lb> <lg> <list> <listBibl> <measure> <name> <note> <num> <orig> <p> <pb> <q> <quote> <ref> <reg> <sic> <term> <title> <unclear></p> <p>figures: <figure> <formula></p>

	<p>header: <idno></p> <p>linking: <seg></p> <p>msdescription: <catchwords> <depth> <dim> <dimensions> <height> <heraldry> <locus> <locusGrp> <material> <msDesc> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark> <width></p> <p>namesdates: <addName> <country> <district> <forename> <geo> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <am> <damage> <ex> <fw> <subst> <supplied></p> <p>character data</p>
Example	<p>In the following example, the translator has supplied a footnote containing an explanation of the term translated as "painterly":</p> <p>And yet it is not only in the great line of Italian renaissance art, but even in the painterly <note place="bottom" resp="#MDMH" type="gloss"> <term xml:lang="de">Malerisch</term>. This word has, in the German, two distinct meanings, one objective, a quality residing in the object, the other subjective, a mode of apprehension and creation. To avoid confusion, they have been distinguished in English as <mentioned>picturesque</mentioned> and <mentioned>painterly</mentioned> respectively. </note> style of the Dutch genre painters of the seventeenth century that drapery has this psychological significance.</p> <pre><!-- elsewhere in the document --> <respStmt xml:id="MDMH"> <resp>translation from German to English</resp> <name>Hottinger, Marie Donald Mackie</name> </respStmt></pre> <p>For this example to be valid, the code MDMH must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header.</p>
Example	<p>The global @n attribute may be used to supply the symbol or number used to mark the note's point of attachment in the source text, as in the following example:</p> <p>Mevorakh b. Saadya's mother, the matriarch of the family during the second half of the eleventh century, <note anchored="true" n="126"> The alleged mention of Judah Nagid's mother in a letter from 1071 is, in fact, a reference to Judah's children; cf. above, nn. 111 and 54. </note> is well known from Geniza documents published by Jacob Mann.</p>

	However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

May contain	Empty element
Note	<p>A <pb> element should appear at the start of the page which it identifies. The global @n attribute indicates the number or other value associated with this page. This will normally be the page number or signature printed on it, since the physical sequence number is implicit in the presence of the <pb> element itself.</p> <p>The @type attribute may be used to characterize the page break in any respect. The more specialized attributes @break, @ed, or @edRef should be preferred when the intent is to indicate whether or not the page break is word-breaking, or to note the source from which it derives.</p>
Example	<p>Page numbers may vary in different editions of a text.</p> <pre><p> ... <pb ed="ed2" n="145"/> <!-- Page 145 in edition "ed2" starts here --&gt; ... &lt;pb ed="ed1" n="283"/&gt; <!-- Page 283 in edition "ed1" starts here--&gt; ... &lt;/p&gt;</pre> </pre>
Example	<p>A page break may be associated with a facsimile image of the page it introduces by means of the @facs attribute</p> <pre><body> <pb facs="page1.png" n="1"/> <!-- page1.png contains an image of the page; the text it contains is encoded here --&gt; &lt;p&gt; &lt!-- ... --&gt; &lt;/p&gt; &lt;pb facs="page2.png" n="2"/&gt; <!-- similarly, for page 2 --&gt; &lt;p&gt; &lt!-- ... --&gt; &lt;/p&gt; &lt;/body&gt;</pre> </pre>
Content model	<content> <empty/> </content>
Schema Declaration	element pb { att.global.attributes,

	<pre> att.typed.attributes, att.edition.attributes, att.spanning.attributes, att.breaking.attributes, empty } </pre>

<revisionDesc>

<revisionDesc> (revision description) summarizes the revision history for a file. [2.6. The Revision Description 2.1.1. The TEI Header and Its Components]

Module	header — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@faccs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.docStatus (@status)
Contained by	header: <teiHeader>
May contain	core: <list> header: <change>

Note	If present on this element, the <code>@status</code> attribute should indicate the current status of the document. The same attribute may appear on any <code><change></code> to record the status at the time of that change. Conventionally <code><change></code> elements should be given in reverse date order, with the most recent change at the start of the list.
Example	<pre><revisionDesc status="embargoed"> <change when="1991-11-11" who="#LB"> deleted chapter 10 </change> </revisionDesc></pre>
Content model	<pre><content> <alternate> <elementRef key="list"/> <elementRef key="listChange"/> <elementRef key="change" maxOccurs="unbounded" minOccurs="1"/> </alternate> </content></pre>
Schema Declaration	<pre>element revisionDesc { att.global.attributes, att.docStatus.attributes, (list listChange change+) }</pre>

<rubric>

<rubric> (rubric) contains the text of any rubric or heading attached to a particular manuscript item, that is, a string of words through which a manuscript or other object signals the beginning of a text division, often with an assertion as to its author and title, which is in some way set off from the text itself, typically in red ink, or by use of different size or type of script, or some other such visual device. [10.6.1. The msItem and msItemStruct Elements]

Module	msdescription — 0

Note	The <seg> element may be used at the encoder's discretion to mark any segments of the text of interest for processing. One use of the element is to mark text features for which no appropriate markup is otherwise defined. Another use is to provide an identifier for some segment which is to be pointed at by some other element—i.e. to

	provide a target, or a part of a target, for a <ptr> or other similar element.
Example	<pre><seg>When are you leaving?</seg> <seg>Tomorrow.</seg></pre>
Example	<pre><s> <seg rend="caps" type="initial-cap">So father's only</seg> glory was the ballfield. </s></pre>
Example	<pre><seg type="preamble"> <seg>Sigmund, <seg type="patronym">the son of Volsung</seg>, was a king in Frankish country.</seg> <seg>Sinfiotli was the eldest of his sons ...</seg> <seg>Borghild, Sigmund's wife, had a brother ... </seg> </seg></pre>

Example	for his nose was as sharp as a pen, and < sic >a Table</ sic > of green fields.
Example	If all that is desired is to call attention to the apparent problem in the copy text, < sic > may be used alone: I don't know, Juan. It's so far in the past now — how < sic >we can</ sic > prove or disprove anyone's theories?
Example	It is also possible, using the < choice > and < corr > elements, to provide a corrected reading: I don't know, Juan. It's so far in the past now — how < choice > < sic >we can</ sic > < corr >can we</ corr > </ choice > prove or disprove anyone's theories?
Example	for his nose was as sharp as a pen, and < choice > < sic >a Table</ sic > < corr >a' babld</ corr > </ choice > of green fields.

Note	<p>When this element appears within an <code><index></code> element, it is understood to supply the form under which an index entry is to be made for that location. Elsewhere, it is understood simply to indicate that its content is to be regarded as a technical or specialised term. It may be associated with a <code><gloss></code> element by means of its <code>@ref</code> attribute; alternatively a <code><gloss></code> element may point to a <code><term></code> element by means of its <code>@target</code> attribute.</p> <p>In formal terminological work, there is frequently discussion over whether terms must be atomic or may include multi-word lexical items, symbolic designations, or phraseological units. The <code><term></code> element may be used to mark any of these. No position is taken on the philosophical issue of what a term can be; the looser definition simply allows the <code><term></code> element to be used by practitioners of any persuasion.</p> <p>As with other members of the <code>att.canonical</code> class, instances of this element occurring in a text may be associated with a canonical definition, either by means of a URI (using the <code>@ref</code> attribute), or by means of some system-specific code value (using the <code>@key</code> attribute). Because the mutually exclusive <code>@target</code> and <code>@cRef</code> attributes overlap with the function of the <code>@ref</code> attribute, they are deprecated and may be removed at a subsequent release.</p>
Example	<p>A computational device that infers structure from grammatical strings of words is known as a <code><term>parser</term></code>, and much of the history of NLP over the last 20 years has been occupied with the design of parsers.</p>
Example	<p>We may define <code><term rend="sc" xml:id="TDPV1">discursal point of view</term></code> as <code><gloss target="#TDPV1">the relationship, expressed through discourse structure, between the implied author or some other addresser, and the fiction.</gloss></code></p>
Example	<p>We may define <code><term ref="#TDPV2" rend="sc">discursal point of view</term></code> as <code><gloss xml:id="TDPV2">the relationship, expressed through discourse structure, between the implied author or some other addresser, and the fiction.</gloss></code></p>
Example	<p>We discuss Leech's concept of <code><term ref="myGlossary.xml#TDPV2" rend="sc">discursal point of view</term></code> below.</p>
Content model	<pre><content> <macroRef key="macro.phraseSeq"/> </content></pre>

Example	<pre><support> <p> <material>Rag paper</material> with <watermark>anchor</watermark> watermark</p> </support></pre>
Content model	<content> <macroRef key="macro.phraseSeq"/> </content>
Schema Declaration	element watermark { att.global.attributes, macro.phraseSeq }

<width>

<p><width> (width) contains a measurement of an object along the axis parallel to its bottom, e.g. perpendicular to the spine of a book or codex. [10.3.4. Dimensions]</p>	
Module	msdescription — 0
Attributes	att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facss)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.dimensions (@unit, @quantity, @extent, @precision, @scope) (att.ranging (@atLeast, @atMost, @min, @max, @confidence))
Member of	model.dimLike model.measureLike
Contained by	<p>core: <abbr> <add> <addrLine> <author> <bibl> <biblScope> <citedRange> <corr> <date> <desc> <editor> <email> <expan> <foreign> <head> <hi> <item> <l> <label> <measure> <name> <note> <num> <orig> <p> <pubPlace> <publisher> <q> <quote> <ref> <reg> <resp> <sic> <street> <term> <textLang> <title> <unclear></p> <p>derived-module-msdesc: <countermark></p> <p>figures: <figDesc></p> <p>header: <authority> <catDesc> <change> <distributor> <edition> <extent> <funder> <handNote> <licence> <principal> <scriptNote> <sponsor></p> <p>linking: <seg></p> <p>msdescription: <accMat> <acquisition> <additions> <catchwords> <collation> <collection> <colophon> <condition> <custEvent> <decoNote> <dimensions> <explicit> <filiation> <finalRubric> <foliation> <heraldry> <incipit> <institution> <layout> <material> <musicNotation> <objectType> <origDate> <origPlace> <origin> <provenance> <repository> <r rubric> <secFol> <signatures> <source> <stamp> <summary> <support> <surrogates> <typeNote> <watermark></p> <p>namesdates: <addName> <country> <district> <forename> <geogFeat> <geogName> <orgName> <persName> <placeName> <region> <settlement> <surname></p> <p>transcr: <damage> <fw> <supplied></p>
May contain	Character data only
Note	If used to specify the depth of a non text-bearing portion of some object, for example a monument, this element conventionally refers to the axis facing the observer, and perpendicular to that indicated by the 'depth' axis.
Example	<width unit="in">4</width>
Content model	<content> <macroRef key="macro.xtext"/> </content>
Schema Declaration	element width { att.global.attributes, att.dimensions.attributes, macro.xtext }

<zone>

<p><zone> defines any two-dimensional area within a <surface> element. [11.1. Digital Facsimiles 11.2.2. Embedded Transcription]</p>							
Module	transcr — 0						
Attributes	<p>att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.coordinated (@start, @ulx, @uly, @lrx, @lry, @points) att.typed (@type, @subtype) att.written (@hand)</p> <p>rotate indicates the amount by which this zone has been rotated clockwise, with respect to the normal orientation of the parent <surface> element as implied by the dimensions given in the <msDesc> element or by the coordinates of the <surface> itself. The orientation is expressed in arc degrees.</p> <table> <tr> <td>Status</td><td>Optional</td></tr> <tr> <td>Datatype</td><td>teidata.count</td></tr> <tr> <td>Default</td><td>0</td></tr> </table>	Status	Optional	Datatype	teidata.count	Default	0
Status	Optional						
Datatype	teidata.count						
Default	0						
Member of	model.linePart						
Contained by	transcr: <surface> <zone>						
May contain	<p>core: <add> <choice> <gap> <graphic> <hi> <lb> <note> <pb> <q> <unclear></p> <p>figures: <figure> <formula></p> <p>linking: <seg></p> <p>transcr: <damage> <fw> <surface> <zone></p> <p>character data</p>						
Note	<p>The position of every zone for a given surface is always defined by reference to the coordinate system defined for that surface.</p> <p>A graphic element contained by a zone represents the whole of the zone.</p> <p>A zone may be of any shape. The attribute <i>@points</i> may be used to define a polygonal zone, using the coordinate system defined by its parent surface.</p> <p>A zone is always a closed polygon. Repeating the initial coordinate at the end of the sequence is optional. To encode an unclosed path, use the <path> element.</p>						
Example	<pre><surface lrx="0" lry="0" ulx="14.54" uly="16.14"> <graphic url="stone.jpg"/> <zone points="4.6,6.3 5.25,5.85 6.2,6.6 8.19222,7.4125 9.89222,6.5875 10.9422,6.1375 11.4422,6.7125 8.21722,8.3125 6.2,7.65"/> </surface></pre>						
	This example defines a non-rectangular zone: see the illustration in section #PH-surfzone.						
Example	<pre><facsimile> <surface lrx="400" lry="280" ulx="50" uly="20"> <zone lrx="500" lry="321" ulx="0" uly="0"> <graphic url="graphic.png"/></pre>						

	<pre></zone> </surface> </facsimile></pre>
	This example defines a zone which has been defined as larger than its parent surface in order to match the dimensions of the graphic it contains.
Content model	<pre><content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.gLike"/> <classRef key="model.graphicLike"/> <classRef key="model.global"/> <elementRef key="surface"/> <classRef key="model.linePart"/> </alternate> </content></pre>
Schema Declaration	<pre>element zone { att.global.attributes, att.coordinated.attributes, att.typed.attributes, att.written.attributes, attribute rotate { text }?, (text model.gLike model.graphicLike model.global surface model.linePart)* }</pre>

Model classes

model.addrPart

model.addrPart	
groups elements such as names or postal codes which may appear as part of a postal address. [3.6.2. Addresses]	
Module	tei — 0
Used by	<address>
Members	model.nameLike [model.nameLike.agent [<name> <orgName> <persName>] model.offsetLike [<geogFeat>] model.persNamePart [<addName> <forename> <surname>] model.placeStateLike [model.placeNamePart [<country> <district> <geogName> <placeName> <region> <settlement>]] <idno>] <addrLine> <postCode> <street>

model.addressLike

model.addressLike

groups elements used to represent a postal or email address. [1. The TEI Infrastructure]	
Module	tei — 0
Used by	model.pPart.data
Members	<address> <email>

model.attributable

model.attributable	
groups elements that contain a word or phrase that can be attributed to a source. [3.3.3. Quotation 4.3.2. Floating Texts]	
Module	tei — 0
Used by	<cit> macro.phraseSeq model.inter
Members	model.quoteLike [<cit> <quote>]

model.availabilityPart

model.availabilityPart	
groups elements such as licences and paragraphs of text which may appear as part of an availability statement [2.2.4. Publication, Distribution, Licensing, etc.]	
Module	tei — 0
Used by	<availability>
Members	<licence>

model.biblLike

model.biblLike	
groups elements containing a bibliographic description. [3.12. Bibliographic Citations and References]	
Module	tei — 0
Used by	<cit> <listBibl> model.inter model.msItemPart <relatedItem> <sourceDesc> <taxonomy>
Members	<bibl> <biblStruct> <listBibl> <msDesc>

model.biblPart

model.biblPart	
groups elements which represent components of a bibliographic description. [3.12. Bibliographic Citations and References]	
Module	tei — 0
Used by	<bibl>
Members	model.imprintPart [<biblScope> <distributor> <pubPlace> <publisher>] model.respLike [<author> <editor>

	<funder> <principal> <respStmt> <sponsor>] <availability> <bibl> <citedRange> <decoNote> <edition> <explicit> <extent> <incipit> <msIdentifier> <relatedItem> <series> <textLang>
--	--

model.choicePart

model.choicePart

groups elements (other than <choice> itself) which can be used within a <choice> alternation. [3.5. Simple Editorial Changes]

Module	tei — 0
Used by	<choice>
Members	<abbr> <am> <corr> <ex> <expan> <orig> <reg> <seg> <sic> <supplied> <unclear>

model.common

model.common

groups common chunk- and inter-level elements. [1.3. The TEI Class System]

Module	tei — 0
Used by	<body> <div> <figure>
Members	model.divPart [model.llike [<l>] model.plike [<p>] <lg>] model.inter [model.attributable [model.quoteLike [<cit> <quote>]] model.bibllike [<bibl> <biblStruct> <listBibl> <msDesc>] model.eglike model.labelLike [<desc> <label>] model.listlike [<list>] model.oddDecl model.stageLike] <include> <q>
Note	This class defines the set of chunk- and inter-level elements; it is used in many content models, including those for textual divisions.

model.dateLike

model.dateLike

groups elements containing temporal expressions. [3.6.4. Dates and Times 13.4. Dates]

Module	tei — 0
Used by	<imprint> model.pPart.data
Members	<date>

model.descLike

model.descLike

groups elements which contain a description of their function.

Module	tei — 0
Used by	<category> <gap> <graphic> <taxonomy>
Members	<desc>

model.dimLike

model.dimLike

groups elements which describe a measurement forming part of the physical dimensions of some object.

Module	tei — 0
Used by	<dimensions>
Members	<depth> <height> <width>

model.divBottom

model.divBottom

groups elements appearing at the end of a text division. [[4.2. Elements Common to All Divisions](#)]

Module	tei — 0
Used by	<body> <div> <figure> <lg> <list>
Members	model.divBottomPart model.divWrapper

model.divLike

model.divLike

groups elements used to represent un-numbered generic structural divisions.

Module	tei — 0
Used by	<body> <div>
Members	<div>

model.divPart

model.divPart

groups paragraph-level elements appearing directly within divisions. [[1.3. The TEI Class System](#)]

Module	tei — 0
Used by	macro.specialPara model.common
Members	model.lLike [<l>] model.pLike [<p>] <lg>
Note	Note that this element class does not include members of the <code>model.inter</code> class, which can appear either within or between paragraph-level items.

model.divTop

model.divTop

groups elements appearing at the beginning of a text division. [4.2. Elements Common to All Divisions]	
Module	tei — 0
Used by	<body> <div> <lg> <list>
Members	model.divTopPart [model.headLike [<head>]] model.divWrapper

model.divTopPart

model.divTopPart	
groups elements which can occur only at the beginning of a text division. [4.6. Title Pages]	
Module	tei — 0
Used by	model.divTop
Members	model.headLike [<head>]

model.emphLike

model.emphLike	
groups phrase-level elements which are typographically distinct and to which a specific function can be attributed. [3.3. Highlighting and Quotation]	
Module	tei — 0
Used by	model.highlighted model.limitedPhrase
Members	<foreign> <term> <title>

model.encodingDescPart

model.encodingDescPart	
groups elements which may be used inside <encodingDesc> and appear multiple times.	
Module	tei — 0
Used by	<encodingDesc>
Members	<classDecl> <projectDesc>

model.global

model.global	
groups elements which may appear at any point within a TEI text. [1.3. The TEI Class System]	
Module	tei — 0
Used by	<address> <bibl> <body> <cit> <date> <div> <figure> <head> <imprint> <l> <lg> <list> macro.phraseSeq macro.phraseSeq.limited macro.specialPara model paraPart <msItem> <origDate> <series> <surface> <surfaceGrp> <text> <zone>

Members	model.global.edit [<gap>] model.global.meta model.milestoneLike [<fw> <lb> <pb>] model.noteLike [<note> <figure>]
----------------	---

model.global.edit

model.global.edit
groups globally available elements which perform a specifically editorial function. [1.3. The TEI Class System]
Module
tei — 0
Used by
model.global
Members
<gap>

model.graphicLike

model.graphicLike
groups elements containing images, formulae, and similar objects. [3.10. Graphics and Other Non-textual Components]
Module
tei — 0
Used by
<cit> <facsimile> <figure> <formula> model.phrase <surface> <zone>
Members
<formula> <graphic>

model.headLike

model.headLike
groups elements used to provide a title or heading at the start of a text division.
Module
tei — 0
Used by
<figure> <listBibl> model.divTopPart <msDesc> <msFrag> <msPart>
Members
<head>

model.hiLike

model.hiLike
groups phrase-level elements which are typographically distinct but to which no specific function can be attributed. [3.3. Highlighting and Quotation]
Module
tei — 0
Used by
<formula> <locus> model.highlighted model.limitedPhrase model.linePart
Members
<hi> <q>

model.highlighted

model.highlighted

groups phrase-level elements which are typographically distinct. [3.3. [Highlighting and Quotation](#)]

Module	tei — 0
Used by	<bibl> model.phrase
Members	model.emphLike [<foreign> <term> <title>] model.hiLike [<hi> <q>]

model.imprintPart

model.imprintPart

groups the bibliographic elements which occur inside imprints. [3.12. [Bibliographic Citations and References](#)]

Module	tei — 0
Used by	<imprint> model.biblPart
Members	<biblScope> <distributor> <pubPlace> <publisher>

model.inter

model.inter

groups elements which can appear either within or between paragraph-like elements. [1.3. [The TEI Class System](#)]

Module	tei — 0
Used by	<head> <l> macro.limitedContent macro.specialPara model.common model paraPart
Members	model.attributable [model.quoteLike [<cit> <quote>]] model.biblLike [<bibl> <biblStruct> <listBibl> <msDesc>] model.egLike model.labelLike [<desc> <label>] model.listLike [<list>] model.oddDecl model.stageLike

model.ILike

model.ILike

groups elements representing metrical components such as verse lines.

Module	tei — 0
Used by	<head> <lg> model.divPart model paraPart
Members	<l>

model.labelLike

model.labelLike

groups elements used to gloss or explain other parts of a document.

Module	tei — 0
---------------	---------

Used by	<lg> model.inter <surface>
Members	<desc> <label>

model.limitedPhrase

model.limitedPhrase

groups phrase-level elements excluding those elements primarily intended for transcription of existing sources. [1.3. The TEI Class System]

Module	tei — 0
Used by	<catDesc> macro.limitedContent macro.phraseSeq.limited
Members	model.emphLike [<foreign> <term> <title>] model.hiLike [<hi> <q>] model.pPart.data [model.addressLike [<address> <email>] model.dateLike [<date>] model.measureLike [<depth> <dim> <geo> <height> <measure> <num> <width>] model.nameLike [model.nameLike.agent [<name> <orgName> <persName>] model.offsetLike [<geogFeat>] model.persNamePart [<addName> <forename> <surname>] model.placeStateLike [model.placeNamePart [<country> <district> <geogName> <placeName> <region> <settlement>] <idno>] model.pPart.editorial [<abbr> <am> <choice> <ex> <expan> <subst>] model.pPart.msdesc [<catchwords> <dimensions> <heraldry> <locus> <locusGrp> <material> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark>] model.phrase.xml model.ptrLike [<ref>]

model.linePart

model.linePart

groups transcriptional elements which appear within lines or zones of a source-oriented transcription within a <sourceDoc> element.

Module	tei — 0
Used by	<zone>
Members	model.hiLike [<hi> <q>] <add> <choice> <damage> <seg> <unclear> <zone>

model.listLike

model.listLike

groups list-like elements. [3.8. Lists]

Module	tei — 0
Used by	model.inter <sourceDesc>
Members	<list>

model.measureLike

model.measureLike

groups elements which denote a number, a quantity, a measurement, or similar piece of text that conveys some numerical

meaning. [3.6.3. Numbers and Measures]

Module	tei — 0
Used by	model.pPart.data
Members	<depth> <dim> <geo> <height> <measure> <num> <width>

model.milestoneLike

model.milestoneLike

groups milestone-style elements used to represent reference systems. [1.3. The TEI Class System 3.11.3. Milestone Elements]

Module	tei — 0
Used by	<listBibl> model.global <subst>
Members	<fw> <lb> <pb>

model.msItemPart

model.msItemPart

groups elements which can appear within a manuscript item description.

Module	tei — 0
Used by	<msItem>
Members	model.biblLike [<bibl> <biblStruct> <listBibl> <msDesc>] model.msQuoteLike [<colophon> <explicit> <finalRubric> <incipit> <rubric> <title>] model.quoteLike [<cit> <quote>] model.respLike [<author> <editor> <funder> <principal> <respStmt> <sponsor>] <decoNote> <filiation> <idno> <msItem> <msItemStruct> <textLang>

model.msQuoteLike

model.msQuoteLike

groups elements which represent passages such as titles quoted from a manuscript as a part of its description.

Module	tei — 0
Used by	model.msItemPart
Members	<colophon> <explicit> <finalRubric> <incipit> <rubric> <title>

model.nameLike

model.nameLike

groups elements which name or refer to a person, place, or organization.

Module	tei — 0
Used by	model.addrPart model.pPart.data

Members	model.nameLike.agent [<name> <orgName> <persName>] model.offsetLike [<geogFeat>] model.persNamePart [<addName> <forename> <surname>] model.placeStateLike [model.placeNamePart [<country> <district> <geogName> <placeName> <region> <settlement>]] <idno>
Note	A superset of the naming elements that may appear in datelines, addresses, statements of responsibility, etc.

model.nameLike.agent

model.nameLike.agent

groups elements which contain names of individuals or corporate bodies. [[3.6. Names, Numbers, Dates, Abbreviations, and Addresses](#)]

Module	tei — 0
Used by	model.nameLike <respStmt>
Members	<name> <orgName> <persName>
Note	This class is used in the content model of elements which reference names of people or organizations.

model.noteLike

model.noteLike

groups globally-available note-like elements. [[3.9. Notes, Annotation, and Indexing](#)]

Module	tei — 0
Used by	<adminInfo> <biblStruct> model.global <monogr> <msItemStruct>
Members	<note>

model.offsetLike

model.offsetLike

groups elements which can appear only as part of a place name. [[13.2.3. Place Names](#)]

Module	tei — 0
Used by	model.nameLike
Members	<geogFeat>

model.pLike

model.pLike

groups paragraph-like elements.

Module	tei — 0
Used by	<availability> <binding> <bindingDesc> <custodialHist> <decoDesc> <editionStmt>

	<encodingDesc> <handDesc> <history> <layoutDesc> model.divPart <msContents> <msDesc> <msFrag> <msItem> <msItemStruct> <msPart> <objectDesc> <physDesc> <projectDesc> <publicationStmt> <recordHist> <scriptDesc> <seal> <sealDesc> <sourceDesc> <supportDesc> <typeDesc>
Members	<p>

model.pPart.data

model.pPart.data	
groups phrase-level elements containing names, dates, numbers, measures, and similar data. [3.6. Names, Numbers, Dates, Abbreviations, and Addresses]	
Module	tei — 0
Used by	<bibl> model.limitedPhrase model.phrase
Members	model.addressLike [<address> <email>] model.dateLike [<date>] model.measureLike [<depth> <dim> <geo> <height> <measure> <num> <width>] model.nameLike [model.nameLike.agent [<name> <orgName> <persName>] model.offsetLike [<geogFeat>] model.persNamePart [<addName> <forename> <surname>] model.placeStateLike [model.placeNamePart [<country> <district> <geogName> <placeName> <region> <settlement>]] <idno>]

model.pPart.edit

model.pPart.edit	
groups phrase-level elements for simple editorial correction and transcription. [3.5. Simple Editorial Changes]	
Module	tei — 0
Used by	<bibl> model.phrase
Members	model.pPart.editorial [<abbr> <am> <choice> <ex> <expan> <subst>] model.pPart.transcriptional [<add> <corr> <damage> <orig> <reg> <sic> <supplied> <unclear>]

model.pPart.editorial

model.pPart.editorial	
groups phrase-level elements for simple editorial interventions that may be useful both in transcribing and in authoring. [3.5. Simple Editorial Changes]	
Module	tei — 0
Used by	model.limitedPhrase model.pPart.edit
Members	<abbr> <am> <choice> <ex> <expan> <subst>

model.pPart.msdesc

model.pPart.msdesc

groups phrase-level elements used in manuscript description. [10. Manuscript Description]	
Module	tei — 0
Used by	model.limitedPhrase model.phrase
Members	<catchwords> <dimensions> <heraldry> <locus> <locusGrp> <material> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark>

model.pPart.transcriptional

model.pPart.transcriptional	
groups phrase-level elements used for editorial transcription of pre-existing source materials. [3.5. Simple Editorial Changes]	
Module	tei — 0
Used by	<am> <lg> model.pPart.edit
Members	<add> <corr> <damage> <orig> <reg> <sic> <supplied> <unclear>

model.paraPart

model.paraPart	
groups elements that may appear in paragraphs and similar elements [3.1. Paragraphs]	
Module	tei — 0
Used by	macro.paraContent
Members	model.gLike model.global [model.global.edit [<gap>] model.global.meta model.milestoneLike [<fw> <lb> <pb>] model.noteLike [<note>] <figure>] model.inter [model.attributable [model.quoteLike [<cit> <quote>]] model.biblLike [<bibl> <biblStruct> <listBibl> <msDesc>] model.egLike model.labelLike [<desc> <label>] model.listLike [<list>] model.oddDecl model.stageLike] model.ILike [<l>] model.phrase [model.graphicLike [<formula> <graphic>] model.highlighted [model.emphLike [<foreign> <term> <title>] model.hiLike [<hi> <qi>] model.IPart model.pPart.data [model.addressLike [<address> <email>] model.dateLike [<date>] model.measureLike [<depth> <dim> <geo> <height> <measure> <num> <width>] model.nameLike [model.nameLike.agent [<name> <orgName> <persName>] model.offsetLike [<geogFeat>] model.persNamePart [<addName> <forename> <surname>] model.placeStateLike [model.placeNamePart [<country> <district> <geogName> <placeName> <region> <settlement>]] <idno>]] model.pPart.edit [model.pPart.editorial [<abbr> <am> <choice> <ex> <expan> <subst>] model.pPart.transcriptional [<add> <corr> <damage> <orig> <reg> <sic> <supplied> <unclear>]] model.pPart.msdesc [<catchwords> <dimensions> <heraldry> <locus> <locusGrp> <material> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark>] model.phrase.xml model.ptrLike [<ref>] model.segLike [<seg>] model.specDescLike] <lg>

model.persNamePart

model.persNamePart	
groups elements which form part of a personal name. [13.2.1. Personal Names]	
Module	namesdates — 0
Used by	model.nameLike
Members	<addName> <forename> <surname>

model.phrase

model.phrase	
groups elements which can occur at the level of individual words or phrases. [1.3. The TEI Class System]	
Module	tei — 0
Used by	<date> <head> <l> macro.phraseSeq macro.specialPara model.paraPart <origDate>
Members	model.graphicLike [<formula> <graphic>] model.highlighted [model.emphLike [<foreign> <term> <title>] model.hiLike [<hi> <qp>] model.IPart model.pPart.data [model.addressLike [<address> <email>] model.dateLike [<date>] model.measureLike [<depth> <dim> <geo> <height> <measure> <num> <width>] model.nameLike [model.nameLike.agent [<name> <orgName> <persName>] model.offsetLike [<geogFeat>] model.persNamePart [<addName> <forename> <surname>] model.placeStateLike [model.placeNamePart [<country> <district> <geogName> <placeName> <region> <settlement>] <idno>] model.pPart.edit [model.pPart.editorial [<abbr> <am> <choice> <ex> <expan> <subst>] model.pPart.transcriptional [<add> <corr> <damage> <orig> <reg> <sic> <supplied> <unclear>] model.pPart.msdesc [<catchwords> <dimensions> <heraldry> <locus> <locusGrp> <material> <objectType> <origDate> <origPlace> <secFol> <signatures> <stamp> <watermark>] model.phrase.xml model.ptrLike [<ref>] model.segLike [<seg>] model.specDescLike
Note	This class of elements can occur within paragraphs, list items, lines of verse, etc.

model.physDescPart

model.physDescPart	
groups specialized elements forming part of the physical description of a manuscript or similar written source.	
Module	msdescription — 0
Used by	<physDesc>
Members	<accMat> <additions> <bindingDesc> <decoDesc> <handDesc> <musicNotation> <objectDesc> <scriptDesc> <sealDesc> <typeDesc>

model.placeNamePart

model.placeNamePart	
groups elements which form part of a place name. [13.2.3. Place Names]	
Module	tei — 0
Used by	<altIdentifier> model.placeStateLike <msIdentifier>
Members	<country> <district> <geogName> <placeName> <region> <settlement>

model.placeStateLike

model.placeStateLike	
groups elements which describe changing states of a place.	
Module	tei — 0

Used by	model.nameLike
Members	model.placeNamePart [<country> <district> <geogName> <placeName> <region> <settlement>]

model.profileDescPart

model.profileDescPart	
groups elements which may be used inside <profileDesc> and appear multiple times.	
Module	tei — 0
Used by	<profileDesc>
Members	<textClass>

model.ptrLike

model.ptrLike	
groups elements used for purposes of location and reference. [3.7. Simple Links and Cross-References]	
Module	tei — 0
Used by	<analytic> <bibl> <biblStruct> <cit> model.limitedPhrase model.phrase model.publicationStmtPart.detail <monogr> <relatedItem> <series>
Members	<ref>

model.publicationStmtPart.agency

model.publicationStmtPart.agency	
groups the child elements of a <publicationStmt> element of the TEI header that indicate an authorising agent. [2.2.4. Publication, Distribution, Licensing, etc.]	
Module	tei — 0
Used by	<publicationStmt>
Members	<authority> <distributor> <publisher>
Note	The ‘agency’ child elements, while not required, are required if one of the ‘detail’ child elements is to be used. It is not valid to have a ‘detail’ child element without a preceding ‘agency’ child element. See also <code>model.publicationStmtPart.detail</code> .

model.publicationStmtPart.detail

model.publicationStmtPart.detail	
groups the agency-specific child elements of the <publicationStmt> element of the TEI header. [2.2.4. Publication, Distribution, Licensing, etc.]	
Module	tei — 0

Used by	<publicationStmt>
Members	model.ptrLike [<ref>] <address> <availability> <date> <idno> <pubPlace>
Note	A ‘detail’ child element may not occur unless an ‘agency’ child element precedes it. See also model.publicationStmtPart.agency.

model.quoteLike

model.quoteLike	
groups elements used to directly contain quotations.	
Module	tei — 0
Used by	model.attributable model.msItemPart
Members	<cit> <quote>

model.resource

model.resource	
groups separate elements which constitute the content of a digital resource, as opposed to its metadata. [1.3. The TEI Class System]	
Module	tei — 0
Used by	<TEI>
Members	<facsimile> <text>

model.respLike

model.respLike	
groups elements which are used to indicate intellectual or other significant responsibility, for example within a bibliographic element.	
Module	tei — 0
Used by	<editionStmt> model.biblPart model.msItemPart <titleStmt>
Members	<author> <editor> <funder> <principal> <respStmt> <sponsor>

model.segLike

model.segLike	
groups elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors 17.1. Linguistic Segment Categories]	
Module	tei — 0
Used by	<bibl> model.phrase

Members	<seg>
Note	The principles on which segmentation is carried out, and any special codes or attribute values used, should be defined explicitly in the <segmentation> element of the <encodingDesc> within the associated TEI header.

model.teiHeaderPart

model.teiHeaderPart	
groups high level elements which may appear more than once in a TEI header.	
Module	tei — 0
Used by	<teiHeader>
Members	<encodingDesc> <include> <profileDesc>

model.titlepagePart

model.titlepagePart	
groups elements which can occur as direct constituents of a title page, such as <docTitle>, <docAuthor>, <docImprint>, or <epigraph>. [4.6. Title Pages]	
Module	tei — 0
Used by	<msItem>
Members	<graphic>

Attribute classes

att.anchoring

att.anchoring									
(anchoring) provides attributes for use on annotations, e.g. notes and groups of notes describing the existence and position of an anchor for annotations.									
Module	tei — 0								
Members	<note>								
Attributes	<p>anchored (anchored) indicates whether the copy text shows the exact place of reference for the note.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.truthValue</td> </tr> <tr> <td>Default</td> <td>true</td> </tr> <tr> <td>Note</td> <td>In modern texts, notes are usually anchored by means of explicit footnote or endnote symbols. An explicit indication of the phrase or line annotated may however be used instead (e.g. ‘page 218, lines 3–4’). The <i>@anchored</i> attribute indicates whether any explicit location is given, whether by symbol or by prose cross-reference. The value true indicates that such an</td> </tr> </table>	Status	Optional	Datatype	teidata.truthValue	Default	true	Note	In modern texts, notes are usually anchored by means of explicit footnote or endnote symbols. An explicit indication of the phrase or line annotated may however be used instead (e.g. ‘page 218, lines 3–4’). The <i>@anchored</i> attribute indicates whether any explicit location is given, whether by symbol or by prose cross-reference. The value true indicates that such an
Status	Optional								
Datatype	teidata.truthValue								
Default	true								
Note	In modern texts, notes are usually anchored by means of explicit footnote or endnote symbols. An explicit indication of the phrase or line annotated may however be used instead (e.g. ‘page 218, lines 3–4’). The <i>@anchored</i> attribute indicates whether any explicit location is given, whether by symbol or by prose cross-reference. The value true indicates that such an								

	<p>explicit location is indicated in the copy text; the value false indicates that the copy text does not indicate a specific place of attachment for the note. If the specific symbols used in the copy text at the location the note is anchored are to be recorded, use the <code>@n</code> attribute.</p> <p>targetEnd (target end) points to the end of the span to which the note is attached, if the note is not embedded in the text at that point.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>Note This attribute is retained for backwards compatibility; it may be removed at a subsequent release of the Guidelines. The recommended way of pointing to a span of elements is by means of the <code>range</code> function of XPointer, as further described in 16.2.4.6. range().</p>
Example	<pre><p>(...) tamen reuerendos dominos archiepiscopum et canonicos Leopolienses necnon episcopum in duplicitibus Quatuortemporibus<anchor xml:id="A55234"/> totaliter expediui...</p> <!-- elsewhere in the document --> <noteGrp targetEnd="#A55234"> <note xml:lang="en"> Quatuor Tempora, so called dry fast days. </note> <note xml:lang="pl"> Quatuor Tempora, tzw. Suche dni postne. </note> </noteGrp></pre>

att.ascribed

att.ascribed	
provides attributes for elements representing speech or action that can be ascribed to a specific individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]	
Module	tei — 0
Members	att.ascribed.directed [<q>] <change>
Attributes	<p>who indicates the person, or group of people, to whom the element content is ascribed.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>In the following example from Hamlet, speeches (<sp>) in the body of the play are linked to <castItem> elements in the <castList> using the <code>@who</code> attribute.</p> <pre><castItem type="role"> <role xml:id="Barnardo">Bernardo</role> </castItem> <castItem type="role"> <role xml:id="Francisco">Francisco</role> <roleDesc>a soldier</roleDesc> </castItem> <!-- ... --> <sp who="#Barnardo"></pre>

	<pre><speaker>Bernardo</speaker> <l n="1">Who's there?</l> </sp> <sp who="#Francisco"> <speaker>Francisco</speaker> <l n="2">Nay, answer me: stand, and unfold yourself.</l> </sp></pre> <p>Note For transcribed speech, this will typically identify a participant or participant group; in other contexts, it will point to any identified <code><person></code> element.</p>
--	--

att.ascribed.directed

att.ascribed.directed

provides attributes for elements representing speech or action that can be directed at a group or individual. [3.3.3. [Quotation 8.3. Elements Unique to Spoken Texts](#)]

Module	tei — 0
Members	<code><q></code>
Attributes	<p>att.ascribed (@who)</p> <p>toWhom indicates the person, or group of people, to whom a speech act or action is directed.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>In the following example from Mary Pix's The False Friend, speeches (<code><sp></code>) in the body of the play are linked to <code><castItem></code> elements in the <code><castList></code> using the <code>@toWhom</code> attribute, which is used to specify who the speech is directed to. Additionally, the <code><stage></code> includes <code>@toWhom</code> to indicate the directionality of the action.</p> <pre><castItem type="role"> <role xml:id="emil">Emilius.</role> </castItem> <castItem type="role"> <role xml:id="lov">Lovisa</role> </castItem> <castItem type="role"> <role xml:id="serv">A servant</role> </castItem> <!-- ... --> <sp toWhom="#lov" who="#emil"> <speaker>Emil.</speaker> <l n="1">My love!</l> </sp> <sp toWhom="#emil" who="#lov"> <speaker>Lov.</speaker> <l n="2">I have no Witness of my Noble Birth</l> <stage toWhom="#serv" who="#emil">Pointing to her Woman.</stage></pre>

	<p><1>But that poor helpless wretch——</1></p> <p></sp></p>
	<p>Note To indicate the recipient of written correspondence, use the elements used in section 2.4.6. Correspondence Description, rather than a @toWhom attribute.</p>

att.breaking

	<p>att.breaking</p> <p>provides attributes to indicate whether or not the element concerned is considered to mark the end of an orthographic token in the same way as whitespace. [3.11.3. Milestone Elements]</p>						
Module	tei — 0						
Members	<lb> <pb>						
Attributes	<p>break indicates whether or not the element bearing this attribute should be considered to mark the end of an orthographic token in the same way as whitespace.</p> <table> <tr> <td>Status</td><td>Recommended</td></tr> <tr> <td>Datatype</td><td>teidata.enumerated</td></tr> <tr> <td>Sample values include</td><td> <p>yes the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace</p> <p>no the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace</p> <p>maybe the encoding does not take any position on this issue.</p> </td></tr> </table> <p>In the following lines from the ‘Dream of the Rood’, linebreaks occur in the middle of the words <i>lāðost</i> and <i>reord-berendum</i>.</p> <pre><ab> ...epesa tome iu icpæs ȝeporden pita heardoft . leodum la<lb break="no"/> ðost ærþan ichim lifes peȝ rihtne ȝerymde reord be<lb break="no"/> rendum hpæt me þaȝepeorðode puldres ealdor ofer... </ab></pre>	Status	Recommended	Datatype	teidata.enumerated	Sample values include	<p>yes the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace</p> <p>no the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace</p> <p>maybe the encoding does not take any position on this issue.</p>
Status	Recommended						
Datatype	teidata.enumerated						
Sample values include	<p>yes the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace</p> <p>no the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace</p> <p>maybe the encoding does not take any position on this issue.</p>						

att.cReferencing

	<p>att.cReferencing</p> <p>provides attributes that may be used to supply a canonical reference as a means of identifying the target of a pointer.</p>		
Module	tei — 0		
Members	<ref> <term>		
Attributes	<p>cRef (canonical reference) specifies the destination of the pointer by supplying a canonical reference expressed using the scheme defined in a <refsDecl> element in the TEI header</p> <table> <tr> <td>Status</td><td>Optional</td></tr> </table>	Status	Optional
Status	Optional		

	<p>Datatype teidata.text</p> <p>Note The value of @cRef should be constructed so that when the algorithm for the resolution of canonical references (described in section 16.2.5. Canonical References) is applied to it the result is a valid URI reference to the intended target.</p> <p>The <refsDecl> to use may be indicated with the @decls attribute.</p> <p>Currently these Guidelines only provide for a single canonical reference to be encoded on any given <ptr> element.</p>
--	---

att.canonical

att.canonical

provides attributes that can be used to associate a representation such as a name or title with canonical information about the object being named or referenced. [[13.1.1. Linking Names and Their Referents](#)]

Module	tei — 0
Members	att.naming [att.personal [<addName> <forename> <name> <orgName> <persName> <placeName> <surname>] <author> <collection> <country> <district> <editor> <geogFeat> <geogName> <institution> <origPlace> <pubPlace> <region> <repository> <settlement>] <authority> <catDesc> <date> <distributor> <funder> <material> <objectType> <principal> <publisher> <resp> <respStmt> <sponsor> <term> <title>
Attributes	<p>key provides an externally-defined means of identifying the entity (or entities) being named, using a coded value of some kind.</p> <p>Status Optional</p> <p>Datatype teidata.text</p> <pre><author> <name key="name 427308" type="organisation">[New Zealand Parliament, Legislative Council]</name> </author></pre> <pre><author> <name key="Hugo, Victor (1802-1885)" ref="http://www.idref.fr/026927608">Victor Hugo</name> </author></pre> <p>Note The value may be a unique identifier from a database, or any other externally-defined string identifying the referent.</p> <p>No particular syntax is proposed for the values of the @key attribute, since its form will depend entirely on practice within a given project. For the same reason, this attribute is not recommended in data interchange, since there is no way of ensuring that the values used by one project are distinct from those used by another. In such a situation, a preferable approach for magic tokens which follows standard practice on the Web is to use a @ref attribute whose value is a tag URI as defined in RFC 4151.</p> <p>ref (reference) provides an explicit means of locating a full definition or identity for the entity being named by means of one or more URIs.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <pre><name ref="http://viaf.org/viaf/109557338" type="person">Seamus Heaney</name></pre> <p>Note The value must point directly to one or more XML elements or other resources by means of one or more URIs, separated by whitespace. If</p>

	more than one is supplied the implication is that the name identifies several distinct entities.
--	--

att.citing

att.citing																																	
provides attributes for specifying the specific part of a bibliographic item being cited. [1.3.1. Attribute Classes]																																	
Module	tei — 0																																
Members	<biblScope> <citedRange>																																
Attributes	<p>unit identifies the unit of information conveyed by the element, e.g. columns, pages, volume, entry.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.enumerated</td> </tr> <tr> <td>Suggested values</td> <td>volume (volume) the element contains a volume number. include:</td> </tr> <tr> <td></td> <td>issue the element contains an issue number, or volume and issue numbers.</td> </tr> <tr> <td></td> <td>page (page) the element contains a page number or page range.</td> </tr> <tr> <td></td> <td>line the element contains a line number or line range.</td> </tr> <tr> <td></td> <td>chapter(chapter) the element contains a chapter indication (number and/or title)</td> </tr> <tr> <td></td> <td>part the element identifies a part of a book or collection.</td> </tr> <tr> <td></td> <td>column the element identifies a column.</td> </tr> <tr> <td></td> <td>entry the element identifies an entry number or label in a list of entries.</td> </tr> <tr> <td>from</td> <td>specifies the starting point of the range of units indicated by the @unit attribute.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype teidata.word</td> </tr> <tr> <td>to</td> <td>specifies the end-point of the range of units indicated by the @unit attribute.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype teidata.word</td> </tr> </table>	Status	Optional	Datatype	teidata.enumerated	Suggested values	volume (volume) the element contains a volume number. include:		issue the element contains an issue number, or volume and issue numbers.		page (page) the element contains a page number or page range.		line the element contains a line number or line range.		chapter (chapter) the element contains a chapter indication (number and/or title)		part the element identifies a part of a book or collection.		column the element identifies a column.		entry the element identifies an entry number or label in a list of entries.	from	specifies the starting point of the range of units indicated by the @unit attribute. Schematron	<pre><sch:rule context="tei:*[@calendar]"> <sch:assert test="string-length(normalize-space(.)) gt 0"> @calendar indicates one or more systems or calendars to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert> </sch:rule></pre>						

	<p>parent element, <i>not</i> the calendar to which the date is normalized.</p> <p>period supplies pointers to one or more definitions of named periods of time (typically <category>s or <calendar>s) within which the datable item is understood to have occurred.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p>
Note	This ‘superclass’ provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.datable.w3c class are provided. If the module for names & dates is loaded, this class also provides attributes from the att.datable.iso and att.datable.custom classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

att.datable.custom

	<p>att.datable.custom</p> <p>provides attributes for normalization of elements that contain datable events to a custom dating system (i.e. other than the Gregorian used by W3 and ISO). [13.4. Dates]</p>
Module	namesdates — 0

Example	<date from="1863-05-28" to="1863-06-01">28 May through 1 June 1863</date>
Note	<p>The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by XML Schema Part 2: Datatypes Second Edition, using the Gregorian calendar.</p> <p>The most commonly-encountered format for the date portion of a temporal attribute is yyyy-mm-dd, but yyyy, --mm, --dd, yyyy-mm, or --mm-dd may also be used. For the time part, the form hh:mm:ss is used.</p> <p>Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.</p>

att.datcat

att.datcat	
<p>provides attributes that are used to align XML elements or attributes with the appropriate Data Categories (DCs) defined by an external taxonomy, in this way establishing the identity of information containers and values, and providing means of interpreting them. [9.5.2. Lexical View 18.3. Other Atomic Feature Values]</p>	
Module	tei — 0
Members	att.segLike [<seg>]
Attributes	<p>datcat provides a pointer to a definition of, and/or general information about, (a) an information container (element or attribute) or (b) a value of an information container (element content or attribute value), by referencing an external taxonomy or ontology. If @valueDatcat is present in the immediate context, this attribute takes on role (a), while @valueDatcat performs role (b).</p> <p>Status Optional</p> <p>Datatype 1-∞ occurrences of teidata.pointer separated by whitespace</p> <p>valueDatcat provides a definition of, and/or general information about a value of an information container (element content or attribute value), by reference to an external taxonomy or ontology. Used especially where a contrast with @datcat is needed.</p> <p>Status Optional</p> <p>Datatype 1-∞ occurrences of teidata.pointer separated by whitespace</p> <p>targetDatcat provides a definition of, and/or general information about, information structure of an object referenced or modeled by the containing element, by reference to an external taxonomy or ontology. This attribute has the characteristics of the @datcat attribute, except that it addresses not its containing element, but an object that is being referenced or modeled by its containing element.</p> <p>Status Optional</p> <p>Datatype 1-∞ occurrences of teidata.pointer separated by whitespace</p>
Example	The example below presents the TEI encoding of the name-value pair <part of speech, common noun>, where the name (key) 'part of speech' is abbreviated as 'POS', and the value, 'common noun' is symbolized by 'NN'. The entire name-value pair is encoded by means of the element <f>. In TEI XML, that element acts as the container, labeled with the @name attribute. Its contents may be complex or simple. In the case at hand, the content is the symbol 'NN'. The @datcat attribute relates the feature <i>name</i> (i.e., the key) to the data category 'part of speech', while the attribute @valueDatcat relates the feature <i>value</i> to the data category common noun. Both these data categories should be defined in an external and preferably open reference taxonomy or ontology.

	<pre><fs> <f datcat="http://hdl.handle.net/11459/CCR_C-396_5a972b93-2294-ab5c-a541-7c344c5f26c3" name="POS"> <symbol value="NN" valueDatcat="http://hdl.handle.net/11459/CCR_C-1256_7ec6083c-23d4-224d-6f94-eecbe6861545"/> </f> <!-- ... --> </fs></pre>
	<p>'NN' is the symbol for common noun used e.g. in the CLAWS-7 tagset defined by the University Centre for Computer Corpus Research on Language at the University of Lancaster. The very same data category used for tagging an early version of the British National Corpus, and coming from the BNC Basic (C5) tagset, uses the symbol 'NNO' (rather than 'NN'). Making these values semantically interoperable would be extremely difficult without a human expert if they were not anchored in a single point of an established reference taxonomy of morphosyntactic data categories. In the case at hand, the string 'http://hdl.handle.net/11459/CCR_C-1256_7ec6083c-23d4-224d-6f94-eecbe6861545' is both a persistent identifier of the data category in question, as well as a pointer to a shared definition of common noun. While the symbols 'NN', 'NNO', and many others (often coming from languages other than English) are implicitly members of the container category 'part of speech', it is sometimes useful not to rely on such an implicit relationship but rather use an explicit identifier for that data category, to distinguish it from other morphosyntactic data categories, such as gender, tense, etc. For that purpose, the above example uses the <code>@datcat</code> attribute to reference a definition of part of speech. The reference taxonomy in this example is the CLARIN Concept Registry. If the feature structure markup exemplified above is to be repeated many times in a single document, it is much more efficient to gather the persistent identifiers in a single place and to only reference them, implicitly or directly, from feature structure markup. The following example is much more concise than the one above and relies on the concepts of feature structure declaration and feature value library, discussed in chapter #FS.</p>
	<pre><fs> <f fVal="#commonNoun" name="POS"/> <!-- ... --> </fs></pre>
	<p>The assumption here is that the relevant feature values are collected in a place that the annotation document in question has access to — preferably, a single document per linguistic resource, for example an <code><fsdDecl></code> that is XIncluded as a sibling of <code><text></code> or a child of <code><encodingDesc></code>; a <code><taxonomy></code> available resource-wide (e.g., in a shared header) is also an option. The example below presents an <code><fvLib></code> element that collects the relevant feature values (most of them omitted). At the same time, this example shows one way of encoding a tagset, i.e., an established inventory of values of (in the case at hand) morphosyntactic categories.</p>
	<pre><fvLib n="POS values"> <symbol datcat="http://hdl.handle.net/11459/CCR_C-396_5a972b93-2294-ab5c-a541-7c344c5f26c3" value="NN" xml:id="commonNoun"/> <symbol datcat="http://hdl.handle.net/11459/CCR_C-1371_fbefbd9ec-a7f4-9a36-d6e9-88ee16b944ae" value="NP" xml:id="properNoun"/> <!-- ... --> </fvLib></pre>
	<p>Note that these Guidelines do not prescribe a specific choice between <code>@datcat</code> and <code>@valueDatcat</code> in such cases. The former is the generic way of referencing a data category, whereas the latter is more specific, in that it references a data category that represents a value. The choice between them comes into play where a single element — or a tight element complex, such as the <code><f>/<symbol></code> complex illustrated above — make it necessary or useful to distinguish between the container data category and its value.</p>
Example	In the context of dictionaries designed with semantic interoperability in mind, the following example ensures

that the `<pos>` element is interpreted as the same information container as in the case of the example of `<name="POS">` above.

```
<gramGrp>
<pos datcat="http://hdl.handle.net/11459/CCR_C-396_5a972b93-2294-ab5c-a541-7c344c5f26c3"
      valueDatcat="http://hdl.handle.net/11459/CCR_C-1256_7ec6083c-23d4-224d-6f94-
      eecbe6861545">NN</pos>
</gramGrp>
```

Efficiency of this type of interoperable markup demands that the references to the particular data categories should best be provided in a single place within the dictionary (or a single place within the project), rather than being repeated inside every entry. For the container elements, this can be achieved at the level of `<tagUsage>`, although here, the `@valueDatcat` attribute should be used, because it is not the `<tagUsage>` element that is associated with the relevant data category, but rather the element `<pos>` (or `<case>`, etc.) that is described by `<tagUsage>`:

```
<tagsDecl partial="true">
<!-- ... -->
<namespace name="http://www.tei-c.org/ns/1.0">
  <tagUsage gi="pos"
    targetDatcat="http://hdl.handle.net/11459/CCR_C-396_5a972b93-2294-ab5c-a541-
    7c344c5f26c3">Contains the part of speech.</tagUsage>
  <tagUsage gi="case"
    targetDatcat="http://hdl.handle.net/11459/CCR_C-1840_9f4e319c-f233-6c90-9117-
    7270e215f039">Contains information about the grammatical case that the described form is inflected
    for.</tagUsage>
<!-- ... -->
</namespace>
</tagsDecl>
```

Another possibility is to shorten the URIs by means of the `<prefixDef>` mechanism, as illustrated below:

```
<listPrefixDef>
  <prefixDef ident="ccr" matchPattern="pos"
    replacementPattern="http://hdl.handle.net/11459/CCR_C-396_5a972b93-2294-ab5c-a541-
    7c344c5f26c3"/>
  <prefixDef ident="ccr" matchPattern="adj"
    replacementPattern="http://hdl.handle.net/11459/CCR_C-1230_23653c21-fca1-edf8-fd7c-
    3df2d6499157"/>
</listPrefixDef>
<!-- ... -->
<entry>
<!--...-->
<form>
  <orth>isotope</orth>
</form>
<gramGrp>
  <pos datcat="ccr:pos"
        valueDatcat="ccr:adj">adj</pos>
</gramGrp>
<!--...-->
```

	<p></entry></p> <p>This mechanism creates implications that are not always wanted, among others, in the case at hand, suggesting that the identifiers ‘pos’ and ‘adj’ belong to a namespace associated with the CLARIN Concept Repository (CCR), whereas that is solely a shorthand mechanism whose scope is the current resource. Documenting this clearly in the header of the dictionary is therefore advised. Yet another possibility is to associate the information about the relationship between a TEI markup element and the data category that it is intended to model already at the level of modeling the dictionary resource, that is, at the level of the ODD, in <equiv> element that is a child of <elementSpec> or <attDef>.</p>
Example	<p>The @targetDatcat attribute is designed to be used in, e.g., feature structure declarations, and is analogous to the @targetLang attribute of the att.pointing class, in that it describes the object that is being referenced, rather than the referencing object.</p> <pre><fDecl name="POS" targetDatcat="http://hdl.handle.net/11459/CCR_C-396_5a972b93-2294-ab5c-a541-7c344c5f26c3"> <fDescr>part of speech (morphosyntactic category)</fDescr> <vRange> <vAlt> <symbol datcat="http://hdl.handle.net/11459/CCR_C-1256_7ec6083c-23d4-224d-6f94-eecbe6861545" value="NN"/> <symbol datcat="http://hdl.handle.net/11459/CCR_C-1371_fbebd9ec-a7f4-9a36-d6e9-88ee16b944ae" value="NP"/> <!-- ... --> </vAlt> </vRange> </fDecl></pre>
	<p>Above, the <fDecl> uses @targetDatcat, because if it were to use @datcat, it would be asserting that it is an instance of the container data category part of speech, whereas it is not — it models a container (<f>) that encodes a part of speech. Note also that it is the <f> that is modeled above, not its values, which are used as direct references to data categories; hence the use of @datcat in the <symbol> element.</p>
Note	<p>The TEI Abstract Model can be expressed as a hierarchy of attribute-value matrices (AVMs) of various types and of various levels of complexity, nested or grouped in various ways. At the most abstract level, an AVM consists of an information container and the value (contents) of that container.</p> <p>A simple example of an XML serialization of such structures is, on the one hand, the opening and closing tags that delimit and name the container, and, on the other, the content enclosed by the two tags that constitutes the value. An analogous example is an attribute name and the value of that attribute.</p> <p>In a TEI XML example of two equivalent serializations expressing the name-value pair <part-of-speech, common-noun>, namely <pos>commonNoun</pos> and pos="common-noun", one would classify the element <pos> and the attribute @pos as containers (mapping onto the first member of the relevant name-value pair), while the character data content of <pos> or the value of @pos would be seen as mapping onto the second member of the pair.</p> <p>The att.datcat class provides means of addressing the containers and their values, while at the same time providing a way to interpret them in the context of external taxonomies or ontologies. Aligning e.g. both the <pos> element and the @pos attribute with the same value of an external reference point (i.e., an entry in an agreed taxonomy) affirms the identity of the concept serialised by both the element container and the attribute container, and optionally provides a definition of that concept (in the case at hand, the concept part of speech).</p> <p>The value of the att.datcat attributes should be a PID (persistent identifier) that points to a specific — and, ideally, shared — taxonomy or ontology. Among the resources that can, to a lesser or greater extent, be used as inventories of (more or less) standardized linguistic categories are the GOLD ontology, CLARIN CCR, OLIA, or TermWeb's DatCatInfo, and also the Universal Dependencies inventory, on the assumption that its</p>

	<p>URIs are going to persist. It is imaginable that a project may choose to address a local taxonomy store instead, but this risks losing the advantage of interchangeability with other projects.</p> <p>Historically, <code>@datcat</code> and <code>@valueDatcat</code> originate from the (the now obsolete) ISO 12620:2009 standard, describing the data model and procedures for a Data Category Registry (DCR). The current version of that standard, ISO 12620-1, does not standardize the serialization of pointers, merely mentioning the TEI <code>att.datcat</code> as an example.</p> <p>Note that no constraint prevents the occurrence of a combination of <code>att.datcat</code> attributes: the <code><fDecl></code> element, which is a natural bearer of the <code>@targetDatcat</code> attribute, is an instance of a specific modeling element, and, in principle, could be semantically fixed by an appropriate reference taxonomy of modeling devices.</p>
--	--

att.declarable

att.declarable	
provides attributes for those elements in the TEI header which may be independently selected by means of the special purpose <code>@decls</code> attribute. [15.3. Associating Contextual Information with a Text]	
Module	tei — 0
Members	<code><availability> <bibl> <biblStruct> <listBibl> <projectDesc> <sourceDesc> <textClass></code>
Attributes	<p>default indicates whether or not this element is selected by default when its parent is selected.</p> <p>Status Optional</p> <p>Datatype teidata.truthValue</p> <p>Legal values true This element is selected if its parent is selected are: false This element can only be selected explicitly, unless it is the only one of its kind, in which case it is selected if its parent is selected. [Default]</p>
Note	The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. Associating Contextual Information with a Text . Only one element of a particular type may have a <code>@default</code> attribute with a value of true.

att.declaring

att.declaring	
provides attributes for elements which may be independently associated with a particular declarable element within the header, thus overriding the inherited default for that element. [15.3. Associating Contextual Information with a Text]	
Module	tei — 0
Members	<code><body> <div> <facsimile> <geo> <graphic> <lg> <msDesc> <p> <ref> <surface> <surfaceGrp> <term> <text></code>
Attributes	<p>decls (declarations) identifies one or more declarable elements within the header, which are understood to apply to the element bearing this attribute and its content.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p>
Note	The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. Associating Contextual Information with a Text .

att.dimensions

att.dimensions <p>provides attributes for describing the size of physical objects.</p>																																					
Module	tei — 0																																				
Members	att.damaged [<damage>] <add> <date> <depth> <dim> <dimensions> <ex> <gap> <geogFeat> <height> <origDate> <subst> <supplied> <unclear> <width>																																				
Attributes	<p>att.ranging (@atLeast, @atMost, @min, @max, @confidence)</p> <p>unit names the unit used for the measurement</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.enumerated</td> </tr> <tr> <td>Suggested values include:</td> <td>cm (centimetres)</td> </tr> <tr> <td></td> <td>mm (millimetres)</td> </tr> <tr> <td></td> <td>in (inches)</td> </tr> <tr> <td></td> <td>line lines of text</td> </tr> <tr> <td></td> <td>char (characters) characters of text</td> </tr> </table> <p>quantity specifies the length in the units specified</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.numeric</td> </tr> </table> <p>extent indicates the size of the object concerned using a project-specific vocabulary combining quantity and units in a single string of words.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.text</td> </tr> </table> <div style="border: 1px solid black; padding: 2px; display: inline-block;"> <gap extent="5 words"/> </div> <div style="border: 1px solid black; padding: 2px; display: inline-block;"> <height extent="half the page"/> </div> <p>precision characterizes the precision of the values specified by the other attributes.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.certainty</td> </tr> </table> <p>scope where the measurement summarizes more than one observation, specifies the applicability of this measurement.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.enumerated</td> </tr> <tr> <td>Sample values include:</td> <td>all measurement applies to all instances.</td> </tr> <tr> <td></td> <td>most measurement applies to most of the instances inspected.</td> </tr> <tr> <td></td> <td>range measurement applies to only the specified range of</td> </tr> </table>	Status	Optional	Datatype	teidata.enumerated	Suggested values include:	cm (centimetres)		mm (millimetres)		in (inches)		line lines of text		char (characters) characters of text	Status	Optional	Datatype	teidata.numeric	Status	Optional	Datatype	teidata.text	Status	Optional	Datatype	teidata.certainty	Status	Optional	Datatype	teidata.enumerated	Sample values include:	all measurement applies to all instances.		most measurement applies to most of the instances inspected.		range measurement applies to only the specified range of

att.divLike

att.divLike	
provides attributes common to all elements which behave in the same way as divisions. [4. Default Text Structure]	
Module	tei — 0
Members	<div> <lg>
Attributes	<p>att.fragmentable (@part)</p> <p>org (organization) specifies how the content of the division is organized.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Legal values are: composite no claim is made about the sequence in which the immediate contents of this division are to be processed, or their inter-relationships.</p> <p>uniform the immediate contents of this element are regarded as forming a logical unit, to be processed in sequence. [Default]</p> <p>sample indicates whether this division is a sample of the original source and if so, from which part.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Legal values are: initial division lacks material present at end in source.</p> <p>medial division lacks material at start and end.</p> <p>final division lacks material at start.</p> <p>unknown position of sampled material within original unknown.</p> <p>complete division is not a sample. [Default]</p>

att.docStatus

att.docStatus	
provides attributes for use on metadata elements describing the status of a document.	
Module	tei — 0
Members	<bibl> <biblStruct> <change> <msDesc> <revisionDesc>
Attributes	<p>status describes the status of a document either currently or, when associated with a dated element, at the time indicated.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Sample values include: approved</p>

	candidate cleared deprecated draft [Default] embargoed expired frozen galley proposed published recommendation submitted unfinished withdrawn
Example	<pre><revisionDesc status="published"> <change status="published" when="2010-10-21"/> <change status="cleared" when="2010-10-02"/> <change status="embargoed" when="2010-08-02"/> <change status="frozen" when="2010-05-01" who="#MSM"/> <change status="draft" when="2010-03-01" who="#LB"/> </revisionDesc></pre>

att.editLike

att.editLike

provides attributes describing the nature of an encoded scholarly intervention or interpretation of any kind. [[3.5. Simple](#)

Editorial Changes 10.3.1. Origination 13.3.2. The Person Element 11.3.1.1. Core Elements for Transcriptional Work	
Module	tei — 0
Members	att.transcriptional [<add> <subst>] <am> <corr> <date> <ex> <expan> <gap> <geogFeat> <geogName> <name> <orgName> <origDate> <origPlace> <origin> <persName> <placeName> <reg> <supplied> <unclear>
Attributes	<p>evidence indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace</p> <p>Suggested values include:</p> <ul style="list-style-type: none"> internal there is internal evidence to support the intervention. external there is external evidence to support the intervention. conjecture the intervention or interpretation has been made by the editor, cataloguer, or scholar on the basis of their expertise. <p>instant indicates whether this is an instant revision or not.</p> <p>Status Optional</p> <p>Datatype teidata.xTruthValue</p> <p>Default false</p>
Note	<p>The members of this attribute class are typically used to represent any kind of editorial intervention in a text, for example a correction or interpretation, or to date or localize manuscripts etc.</p> <p>Each pointer on the @source (if present) corresponding to a witness or witness group should reference a bibliographic citation such as a <witness>, <msDesc>, or <bibl> element, or another external bibliographic citation, documenting the source concerned.</p>

att.edition

att.edition	
provides attributes identifying the source edition from which some encoded feature derives.	
Module	tei — 0
Members	<lb> <pb>
Attributes	<p>ed (edition) supplies a sigil or other arbitrary identifier for the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.word separated by whitespace</p> <p>edRef (edition reference) provides a pointer to the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p>
Example	<1>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit</1> <1>Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</1> <1>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe,</1>
Example	<listBibl> <bibl xml:id="stapledon1937"> <author>Olaf Stapledon</author>,

```

<title>Starmaker</title>, <publisher>Methuen</publisher>, <date>1937</date>
</bibl>
<bibl xml:id="stapledon1968">
<author>Olaf Stapledon</author>,
<title>Starmaker</title>, <publisher>Dover</publisher>, <date>1968</date>
</bibl>
</listBibl>
<!-- ... -->
<p>Looking into the future aeons from the supreme moment of
the cosmos, I saw the populations still with all their
strength maintaining the<pb edRef="#stapledon1968" n="411"/>essentials of their ancient culture,
still living their personal lives in zest and endless
novelty of action, ... I saw myself still
preserving, though with increasing difficulty, my lucid
con-<pb edRef="#stapledon1937" n="291"/>sciousness;</p>

```

att.fragmentable

att.fragmentable

provides attributes for representing fragmentation of a structural element, typically as a consequence of some overlapping hierarchy.

Module	tei — 0								
Members	att.divLike [<div> <lg>] att.segLike [<seg>] <l> <p>								
Attributes	<p>part specifies whether or not its parent element is fragmented in some way, typically by some other overlapping structure: for example a speech which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.enumerated</td> </tr> <tr> <td>Legal values</td> <td> Y (yes) the element is fragmented in some (unspecified) respect N (no) the element is not fragmented, or no claim is made as to its completeness [Default] I (initial) this is the initial part of a fragmented element M (medial) this is a medial part of a fragmented element F (final) this is the final part of a fragmented element </td> </tr> <tr> <td>Note</td> <td>The values I, M, or F should be used only where it is clear how the element may be reconstituted.</td> </tr> </table>	Status	Optional	Datatype	teidata.enumerated	Legal values	Y (yes) the element is fragmented in some (unspecified) respect N (no) the element is not fragmented, or no claim is made as to its completeness [Default] I (initial) this is the initial part of a fragmented element M (medial) this is a medial part of a fragmented element F (final) this is the final part of a fragmented element	Note	The values I, M, or F should be used only where it is clear how the element may be reconstituted.
Status	Optional								
Datatype	teidata.enumerated								
Legal values	Y (yes) the element is fragmented in some (unspecified) respect N (no) the element is not fragmented, or no claim is made as to its completeness [Default] I (initial) this is the initial part of a fragmented element M (medial) this is a medial part of a fragmented element F (final) this is the final part of a fragmented element								
Note	The values I, M, or F should be used only where it is clear how the element may be reconstituted.								

att.global

Status	Optional																				
Datatype	teidata.text																				
Note	The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.																				
Status	Optional																				
Datatype	teidata.language																				
<p><p> ... The consequences of this rapid depopulation were the loss of the last <foreign xml:lang="rap">ariki-</foreign> or chief (Routledge 1920:205,210) and their connections to ancestral territorial organization.</p></p>																					
Note	The <code>@xml:lang</code> value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify <code>@xml:lang</code> at the highest appropriate level, noticing that a different default may be needed for the <code><teiHeader></code> from that																				

	<p>needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages.</p> <p>Only attributes with free text values (rare in these guidelines) will be in the scope of <code>@xml:lang</code>.</p> <p>The authoritative list of registered language subtags is maintained by IANA and is available at http://www.iana.org/assignments/language-subtag-registry. For a good general overview of the construction of language tags, see https://www.w3.org/International/articles/language-tags/, and for a practical step-by-step guide, see https://www.w3.org/International/questions/qa-choosing-language-tags.en.php.</p>						
<code>xml:base</code>	<p>The value used must conform with BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <code><language></code> element with a matching value for its <code>@ident</code> attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF)Internet Engineering Task Force definitions.</p> <p><code>xml:base</code> provides a base URI reference with which applications can resolve relative URI references into absolute URI references.</p> <table> <thead> <tr> <th>Status</th><th>Optional</th></tr> <tr> <th>Datatype</th><th><code>teidata.pointer</code></th></tr> </thead> <tbody> <tr> <td colspan="2"> <pre><div type="bibl"> <head>Selections from <title level="m">The Collected Letters of Robert Southey. att.global.linking

att.global.linking

provides a set of attributes for hypertextual linking. [16. Linking, Segmentation, and Alignment]

Module	linking — 0
Members	<pre> att.global [<TEI> <abbr> <accMat> <acquisition> <add> <addName> <additional> <additions> <addrLine> <address> <adminInfo> <altIdentifier> <am> <analytic> <author> <authority> <availability> <bibl> <biblScope> <biblStruct> <binding> <bindingDesc> <body> <catDesc> <catchwords> <category> <change> <choice> <cit> <citedRange> <classDecl> <collation> <collection> <colophon> <condition> <corr> <countermark> <country> <custEvent> <custodialHist> <damage> <date> <decoDesc> <decoNote> <depth> <desc> <dim> <dimensions> <distributor> <district> <div> <edition> <editionStmt> <editor> <email> <encodingDesc> <ex> <expan> <explicit> <extent> <facsimile> <figDesc> <figure> <fileDesc> <filiation> <finalRubric> <foliation> <foreign> <forename> <formula> <funder> <fw> <gap> <geo> <geogFeat> <geogName> <graphic> <handDesc> <handNote> <head> <height> <heraldry> <hi> <history> <idno> <imprint> <incipit> <institution> <item> <keywords> <label> <layout> <layoutDesc> <lb> <lg> <licence> <list> <listBibl> <locus> <locusGrp> <material> <measure> <monogr> <msContents> <msDesc> <msFrag> <msIdentifier> <msItem> <msItemStruct> <msName> <msPart> <musicNotation> <name> <note> <num> <objectDesc> <objectType> <orgName> <orig> <origDate> <origPlace> <origin> <p> <pb> <persName> <physDesc> <placeName> <postCode> <principal> <profileDesc> <projectDesc> <provenance> <pubPlace> <publicationStmt> <publisher> <q> <quote> <recordHist> <ref> <reg> <region> <relatedItem> <repository> <resp> <respStmt> <revisionDesc> <rubric> <scriptDesc> <scriptNote> <seal> <sealDesc> <secFol> <seg> <series> <settlement> <sic> <signatures> <source> <sourceDesc> <sponsor> <stamp> <street> <subst> <summary> <supplied> <support> <supportDesc> <surface> <surfaceGrp> <surname> <surrogates> <taxonomy> <teiHeader> <term> <text> <textClass> <textLang> <title> <titleStmt> <typeDesc> <typeNote> <unclear> <watermark> <width> <zone>] <countermark> </pre>
Attributes	<p>corresp (corresponds) points to elements that correspond to the current element in some way.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <div style="border: 1px solid black; padding: 5px;"> <pre> <group> <text xml:id="t1-g1-t1" xml:lang="mi"> <body xml:id="t1-g1-t1-body1"> <div type="chapter"> </pre> </div>

```

<head>He Whakamaramatanga mo te Ture Hoko, Riihi hoki, i nga Whenua Maori,
1876.</head>
<p>...</p>
</div>
</body>
</text>
<text xml:id="t1-g1-t2"
xml:lang="en">
<body corresp="#t1-g1-t1-body1"
xml:id="t1-g1-t2-body1">
<div type="chapter">
<head>An Act to regulate the Sale, Letting, and Disposal of Native Lands, 1876.</head>
<p>...</p>
</div>
</body>
</text>
</group>

```

In this example a `<group>` contains two `<text>`s, each containing the same document in a different language. The correspondence is indicated using `@corresp`. The language is indicated using `@xml:lang`, whose value is inherited; both the tag with the `@corresp` and the tag pointed to by the `@corresp` inherit the value from their immediate parent.

```

<!-- In a placeography called "places.xml" --><place corresp="people.xml#LOND2
people.xml#GENI1"
xml:id="LOND1">
<placeName>London</placeName>
<desc>The city of London...</desc>
</place>
<!-- In a literary personography called "people.xml" -->
<person corresp="places.xml#LOND1 #GENI1"
xml:id="LOND2">
<persName type="lit">London</persName>
<note>
<p>Allegorical character representing the city of
<placeName ref="places.xml#LOND1">London</placeName>.</p>
</note>
</person>
<person corresp="places.xml#LOND1 #LOND2"
xml:id="GENI1">
<persName type="lit">London's Genius</persName>
<note>
<p>Personification of London's genius. Appears as an
allegorical character in mayoral shows.
</p>
</note>
</person>

```

In this example, a `<place>` element containing information about the city of London is linked with two `<person>` elements in a literary personography. This correspondence represents a slightly looser relationship than the one in the preceding example; there is no sense in which an allegorical character could be substituted for the physical city, or vice

	<p>versa, but there is obviously a correspondence between them.</p> <p>synch (synchronous) points to elements that are synchronous with the current element.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>sameAs points to an element that is the same as the current element.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>copyOf points to an element of which the current element is a copy.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>Note Any content of the current element should be ignored. Its true content is that of the element being pointed at.</p> <p>next points to the next element of a virtual aggregate of which the current element is part.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>Note It is recommended that the element indicated be of the same type as the element bearing this attribute.</p> <p>prev (previous) points to the previous element of a virtual aggregate of which the current element is part.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>Note It is recommended that the element indicated be of the same type as the element bearing this attribute.</p> <p>exclude points to elements that are in exclusive alternation with the current element.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>select selects one or more alternants; if one alternant is selected, the ambiguity or uncertainty is marked as resolved. If more than one alternant is selected, the degree of ambiguity or uncertainty is marked as reduced by the number of alternants not selected.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>Note This attribute should be placed on an element which is superordinate to all of the alternants from which the selection is being made.</p>

Attributes	<p>source specifies the source from which some aspect of this element is drawn.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>1–∞ occurrences of teidata.pointer separated by whitespace</td> </tr> <tr> <td>Schematron</td> <td><sch:rule context="tei:*[@source]"> <sch:let name="srcs" value="tokenize(normalize-space(@source), ' ')"/> <sch:report test="(self::tei:classRef self::tei:dataRef self::tei:elementRef self::tei:macroRef self::tei:moduleRef self::tei:schemaSpec) and \$srcs[2]"> When used on a schema description element (like <sch:value-of select="name(.)"/>), the @source attribute should have only 1 value. (This one has <sch:value-of select="count(\$srcs)" />.) </sch:report> </sch:rule></td> </tr> <tr> <td>Note</td> <td>The @source attribute points to an external source. When used on an element describing a schema component (<classRef>, <dataRef>, <elementRef>, <macroRef>, <moduleRef>, or <schemaSpec>), it</td> </tr> </table>	Status	Optional	Datatype	1–∞ occurrences of teidata.pointer separated by whitespace	Schematron	<sch:rule context="tei:*[@source]"> <sch:let name="srcs" value="tokenize(normalize-space(@source), ' ')"/> <sch:report test="(self::tei:classRef self::tei:dataRef self::tei:elementRef self::tei:macroRef self::tei:moduleRef self::tei:schemaSpec) and \$srcs[2]"> When used on a schema description element (like <sch:value-of select="name(.)"/>), the @source attribute should have only 1 value. (This one has <sch:value-of select="count(\$srcs)" />.) </sch:report> </sch:rule>	Note	The @source attribute points to an external source. When used on an element describing a schema component (<classRef>, <dataRef>, <elementRef>, <macroRef>, <moduleRef>, or <schemaSpec>), it
Status	Optional								
Datatype	1–∞ occurrences of teidata.pointer separated by whitespace								
Schematron	<sch:rule context="tei:*[@source]"> <sch:let name="srcs" value="tokenize(normalize-space(@source), ' ')"/> <sch:report test="(self::tei:classRef self::tei:dataRef self::tei:elementRef self::tei:macroRef self::tei:moduleRef self::tei:schemaSpec) and \$srcs[2]"> When used on a schema description element (like <sch:value-of select="name(.)"/>), the @source attribute should have only 1 value. (This one has <sch:value-of select="count(\$srcs)" />.) </sch:report> </sch:rule>								
Note	The @source attribute points to an external source. When used on an element describing a schema component (<classRef>, <dataRef>, <elementRef>, <macroRef>, <moduleRef>, or <schemaSpec>), it								

	<p>identifies the source from which declarations for the components should be obtained.</p> <p>On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn.</p> <p>In either case, the location may be provided using any form of URI, for example an absolute URI, a relative URI, a private scheme URI of the form <code>tei:x.y.z</code>, where <code>x.y.z</code> indicates the version number, e.g. <code>tei:4.3.2</code> for TEI P5 release 4.3.2 or (as a special case) <code>tei:current</code> for whatever is the latest release, or a private scheme URI that is expanded to an absolute URI as documented in a <code><prefixDef></code>.</p> <p>When used on elements describing schema components, <code>@source</code> should have only one value; when used on other elements multiple values are permitted.</p>
Example	<pre><p> <!-- ... --> As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>) tells us, <quote source="#mcc_2012">'Collaboration' is a problematic and should be a contested term.</quote> <!-- ... --> </p></pre>
Example	<pre><p> <!-- ... --> <quote source="#chicago_15_ed">Grammatical theories are in flux, and the more we learn, the less we seem to know.</quote> <!-- ... --> </p> <!-- ... --> <bibl xml:id="chicago_15_ed"> <title level="m">The Chicago Manual of Style</title>, <edition>15th edition</edition>. <pubPlace>Chicago</pubPlace>; <publisher>University of Chicago Press</publisher> (<date>2003</date>), <biblScope unit="page">p.147</biblScope>. </bibl></pre>
Example	<pre><elementRef key="p" source="tei:2.0.1"/></pre> <p>Include in the schema an element named <code><p></code> available from the TEI P5 2.0.1 release.</p>
Example	<pre><schemaSpec ident="myODD" source="mycompiledODD.xml"> <!-- further declarations specifying the components required --> </schemaSpec></pre> <p>Create a schema using components taken from the file <code>mycompiledODD.xml</code>.</p>

att.handFeatures

att.handFeatures

provides attributes describing aspects of the hand in which a manuscript is written. [11.3.2.1. Document Hands]

Module	tei — 0
Members	<handNote> <scriptNote> <typeNote>
Attributes	<p>scribe gives a name or other identifier for the scribe believed to be responsible for this hand.</p> <p style="padding-left: 2em;">Status Optional</p> <p style="padding-left: 2em;">Datatype teidata.name</p> <p>scribeRef points to a full description of the scribe concerned, typically supplied by a <person> element elsewhere in the description.</p> <p style="padding-left: 2em;">Status Optional</p> <p style="padding-left: 2em;">Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>script characterizes the particular script or writing style used by this hand, for example <i>secretary</i>, <i>copperplate</i>, <i>Chancery</i>, <i>Italian</i>, etc.</p> <p style="padding-left: 2em;">Status Optional</p> <p style="padding-left: 2em;">Datatype 1–∞ occurrences of teidata.name separated by whitespace</p> <p>scriptRef points to a full description of the script or writing style used by this hand, typically supplied by a <scriptNote> element elsewhere in the description.</p> <p style="padding-left: 2em;">Status Optional</p> <p style="padding-left: 2em;">Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>medium describes the tint or type of ink, e.g. <i>brown</i>, or other writing medium, e.g. <i>pencil</i></p> <p style="padding-left: 2em;">Status Optional</p> <p style="padding-left: 2em;">Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace</p> <p>scope specifies how widely this hand is used in the manuscript.</p> <p style="padding-left: 2em;">Status Optional</p> <p style="padding-left: 2em;">Datatype teidata.enumerated</p> <p>Legal values are: sole only this hand is used throughout the manuscript</p> <p style="text-align: center;"> </p> <p style="text-align: center;">major this hand is used through most of the manuscript</p> <p style="text-align: center;"> </p> <p style="text-align: center;">minor this hand is used occasionally in the manuscript</p>
Note	Usually either @script or @scriptRef, and similarly, either @scribe or @scribeRef, will be supplied.

att.internetMedia

att.internetMedia	
provides attributes for specifying the type of a computer resource using a standard taxonomy.	
Module	tei — 0
Members	att.media [<graphic>] <ref>
Attributes	<p>MimeType (MIME media type) specifies the applicable multimedia internet mail extension (MIME) media type</p> <p style="padding-left: 2em;">Status Optional</p> <p style="padding-left: 2em;">Datatype 1–∞ occurrences of teidata.word separated by whitespace</p>
Example	<p>In this example @MimeType is used to indicate that the URL points to a TEI XML file encoded in UTF-8.</p> <p style="margin-left: 40px;"><ref mimeType="application/tei+xml; charset=UTF-8" target="https://raw.githubusercontent.com/TEIC/TEI/dev/P5/Source/guidelines-en.xml"/></p>
Note	This attribute class provides an attribute for describing a computer resource, typically

	available over the internet, using a value taken from a standard taxonomy. At present only a single taxonomy is supported, the Multipurpose Internet Mail Extensions (MIME) Media Type system. This typology of media types is defined by the Internet Engineering Task Force in RFC 2046 . The list of types is maintained by the Internet Assigned Numbers Authority (IANA). The <code>@mimeType</code> attribute must have a value taken from this list.
--	---

att.measurement

att.measurement									
provides attributes to represent a regularized or normalized measurement.									
Module	tei — 0								
Members	<measure>								
Attributes	<p>unit (unit) indicates the units used for the measurement, usually using the standard symbol for the desired units.</p> <table> <tr> <td>Status</td><td>Optional</td></tr> <tr> <td>Datatype</td><td>teidata.enumerated</td></tr> <tr> <td>Suggested values</td><td>m (metre) SI base unit of length</td></tr> <tr> <td>include:</td><td> kg (kilogram) SI base unit of mass s (second) SI base unit of time Hz (hertz) SI unit of frequency Pa (pascal) SI unit of pressure or stress Ω (ohm) SI unit of electric resistance L (litre) 1 dm³ t (tonne) 10³ kg ha (hectare) 1 hm² Å (ångström) 10⁻¹⁰ m ml (millilitre) cm (centimetre) dB (decibel) see remarks, below kbit (kilobit) 10³ or 1000 bits </td></tr> </table>	Status	Optional	Datatype	teidata.enumerated	Suggested values	m (metre) SI base unit of length	include:	kg (kilogram) SI base unit of mass s (second) SI base unit of time Hz (hertz) SI unit of frequency Pa (pascal) SI unit of pressure or stress Ω (ohm) SI unit of electric resistance L (litre) 1 dm ³ t (tonne) 10 ³ kg ha (hectare) 1 hm ² Å (ångström) 10 ⁻¹⁰ m ml (millilitre) cm (centimetre) dB (decibel) see remarks, below kbit (kilobit) 10 ³ or 1000 bits
Status	Optional								
Datatype	teidata.enumerated								
Suggested values	m (metre) SI base unit of length								
include:	kg (kilogram) SI base unit of mass s (second) SI base unit of time Hz (hertz) SI unit of frequency Pa (pascal) SI unit of pressure or stress Ω (ohm) SI unit of electric resistance L (litre) 1 dm ³ t (tonne) 10 ³ kg ha (hectare) 1 hm ² Å (ångström) 10 ⁻¹⁰ m ml (millilitre) cm (centimetre) dB (decibel) see remarks, below kbit (kilobit) 10 ³ or 1000 bits								

	<p>Kibit (kibibit) 2^{10} or 1024 bits</p> <p>kB (kilobyte) 10^3 or 1000 bytes</p> <p>KiB (kibibyte) 2^{10} or 1024 bytes</p> <p>MB (megabyte) 10^6 or 1 000 000 bytes</p> <p>MiB (mebibyte) 2^{20} or 1 048 576 bytes</p> <p>Note If the measurement being represented is not expressed in a particular unit, but rather is a number of discrete items, the unit count should be used, or the <code>@unit</code> attribute may be left unspecified.</p> <p>Wherever appropriate, a recognized SI unit name should be used (see further http://www.bipm.org/en/publications/si-brochure/; http://physics.nist.gov/cuu/Units/). The list above is indicative rather than exhaustive.</p> <p>unitRef points to a unique identifier stored in the <code>@xml:id</code> of a <code><unitDef></code> element that defines a unit of measure.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>quantity (quantity) specifies the number of the specified units that comprise the measurement</p> <p>Status Optional</p> <p>Datatype teidata.numeric</p> <p>commodity (commodity) indicates the substance that is being measured</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.word separated by whitespace</p> <p>Note In general, when the commodity is made of discrete entities, the plural form should be used, even when the measurement is of only one of them.</p>
Schematron	<sch:rule context="tei:*[@unitRef]"> <sch:report role="info" test="@unit">The @unit attribute may be unnecessary when @unitRef is present.</sch:report> </sch:rule>
Note	<p>This attribute class provides a triplet of attributes that may be used either to regularize the values of the measurement being encoded, or to normalize them with respect to a standard measurement system.</p> <pre><1>So weren't you gonna buy <measure commodity="ice cream" quantity="0.5" unit="gal">half a gallon</measure>, baby</1> <1>So won't you go and buy <measure commodity="ice cream" quantity="1.893" unit="L">half a gallon</measure>, baby?</1></pre> <p>The unit should normally be named using the standard symbol for an SI unit (see further http://www.bipm.org/en/publications/si-brochure/; http://physics.nist.gov/cuu/Units/). However, encoders may also specify measurements using informally defined units such as lines or characters.</p>

att.media

att.media	
provides attributes for specifying display and related properties of external media.	
Module	tei — 0
Members	<graphic>
Attributes	<p>att.internetMedia (@mimeType)</p> <p>width Where the media are displayed, indicates the display width Status Optional Datatype teidata.outputMeasurement</p> <p>height Where the media are displayed, indicates the display height Status Optional Datatype teidata.outputMeasurement</p> <p>scale Where the media are displayed, indicates a scale factor to be applied when generating the desired display size Status Optional Datatype teidata.numeric</p>

att.msClass

att.msClass	
provides attributes to indicate text type or classification. [10.6. Intellectual Content 10.6.1. The msItem and msItemStruct Elements]	
Module	msdescription — 0
Members	<msContents> <msItem> <msItemStruct>
Attributes	<p>class identifies the text types or classifications applicable to this item by pointing to other elements or resources defining the classification concerned.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p>

att.msExcerpt

att.msExcerpt	
(manuscript excerpt) provides attributes used to describe excerpts from a manuscript placed in a description thereof. [10.6. Intellectual Content]	
Module	msdescription — 0
Members	<colophon> <explicit> <finalRubric> <incipit> <msContents> <msItem> <msItemStruct> <quote> <rubric>
Attributes	<p>defective indicates whether the passage being quoted is defective, i.e. incomplete through loss or damage.</p> <p>Status Optional</p> <p>Datatype teidata.xTruthValue</p>
Note	In the case of an incipit, indicates whether the incipit as given is defective, i.e. the first words of the text as preserved, as opposed to the first words of the work itself. In the case of an explicit, indicates whether the explicit as given is defective, i.e. the final words

	of the text as preserved, as opposed to what the closing words would have been had the text of the work been whole.
--	---

att.naming

att.naming

provides attributes common to elements which refer to named persons, places, organizations etc. [3.6.1. Referring Strings
13.3.6. Names and Nyms]

Module	tei — 0
Members	att.personal [<addName> <forename> <name> <orgName> <persName> <placeName> <surname>] <author> <collection> <country> <district> <editor> <geogFeat> <geogName> <institution> <origPlace> <pubPlace> <region> <repository> <settlement>
Attributes	<p>att.canonical (@key, @ref)</p> <p>role may be used to specify further information about the entity referenced by this name in the form of a set of whitespace-separated values, for example the occupation of a person, or the status of a place.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace</p> <p>nymRef (reference to the canonical name) provides a means of locating the canonical form (nym) of the names associated with the object named by the element bearing it.</p> <p>Status Optional</p> <p>Datatype 1–∞ occurrences of teidata.pointer separated by whitespace</p> <p>Note The value must point directly to one or more XML elements by means of one or more URIs, separated by whitespace. If more than one is supplied, the implication is that the name is associated with several distinct canonical names.</p>

att.notated

att.notated

provides attributes to indicate any specialised notation used for element content.

Module	tei — 0
Members	<formula> <quote> <seg>
Attributes	<p>notation names the notation used for the content of the element.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p>

att.personal

att.personal

(attributes for components of names usually, but not necessarily, personal names) common attributes for those elements which form part of a name usually, but not necessarily, a personal name. [13.2.1. Personal Names]

Module	tei — 0
---------------	---------

Members	<addName> <forename> <name> <orgName> <persName> <placeName> <surname>

att.pointing

att.pointing

provides a set of attributes used by all elements which point to other elements by means of one or more URI references.
[\[1.3.1.1.2. Language Indicators 3.7. Simple Links and Cross-References\]](#)

Module	tei — 0
Members	<p><citedRange> <licence> <locus> <note> <ref> <term></p>
Attribute	<p>targetLang specifies the language of the content to be found at the destination referenced by <i>@target</i>, using a 'language tag' generated according to BCP 47.</p> <p>Status Optional</p> <p>Datatype teidata.language</p> <p>Schematron</p> <pre><sch:rule context="tei:[not(self::tei:schemaSpec)][@targetLang]"> <sch:assert test="@target">@targetLang should only be used on <sch:name/> if @target is specified.</sch:assert> </sch:rule></pre> <pre><linkGrp xml:id="pol-swh_aln_2.1-linkGrp"> <ptr target="pol/UDHR/text.xml#pol_txt_1-head" targetLang="pl" type="tuv" xml:id="pol-swh_aln_2.1.1-ptr"/> <ptr target="swh/UDHR/text.xml#swh_txt_1-head" targetLang="sw" type="tuv" xml:id="pol-swh_aln_2.1.2-ptr"/> </linkGrp></pre> <p>In the example above, the <code><linkGrp></code> combines pointers at parallel fragments of the <i>Universal Declaration of Human Rights</i>: one of them is in Polish, the other in Swahili.</p> <p>Note The value must conform to BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <code><language></code> element with a matching value for its <i>@ident</i> attribute should</p>

	<p>be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF)Internet Engineering Task Force definitions.</p>
target	<p>specifies the destination of the reference by supplying one or more URI References</p> <p>Status Optional</p> <p>Datatype 1-∞ occurrences of teidata.pointer separated by whitespace</p> <p>Note One or more syntactically valid URI references, separated by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. TEI%20Consortium.</p>
evaluate	<p>(evaluate) specifies the intended meaning when the target of a pointer is itself a pointer.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Legal values are:</p> <ul style="list-style-type: none"> all if the element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer. one if the element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer. none no further evaluation of targets is carried out beyond that needed to find the element specified in the pointer's target. <p>Note If no value is given, the application program is responsible for deciding (possibly on the basis of user input) how far to trace a chain of pointers.</p>

att.ranging

att.ranging	
provides attributes for describing numerical ranges.	
Module	tei — 0
Members	att.dimensions [att.damaged [<damage>] <add> <date> <depth> <dim> <dimensions> <ex> <gap> <geogFeat> <height> <origDate> <subst> <supplied> <unclear> <width>] <measure> <num>
Attributes	<p>atLeast gives a minimum estimated value for the approximate measurement.</p> <p>Status Optional</p> <p>Datatype teidata.numeric</p> <p>atMost gives a maximum estimated value for the approximate measurement.</p> <p>Status Optional</p> <p>Datatype teidata.numeric</p> <p>min where the measurement summarizes more than one observation or a range, supplies the minimum value observed.</p> <p>Status Optional</p> <p>Datatype teidata.numeric</p>

	<p>max where the measurement summarizes more than one observation or a range, supplies the maximum value observed.</p> <p>Status Optional</p> <p>Datatype teidata.numeric</p> <p>confidence specifies the degree of statistical confidence (between zero and one) that a value falls within the range specified by @min and @max, or the proportion of observed values that fall within that range.</p> <p>Status Optional</p> <p>Datatype teidata.probability</p>
Schematron	<pre><sch:rule context="/*[(@atLeast and @atMost) or (@min and @max)]"> <sch:let name="f" value="(@atLeast,@min)[1]"/> <sch:let name="t" value="(@atMost,@max)[1]"/> <sch:let name="bothnumbers" value="\$f castable as xs:float and \$t castable as xs:float"/> <sch:let name="fv" value="if (\$bothnumbers) then xs:float(\$f) else ()"/> <sch:let name="tv" value="if (\$bothnumbers) then xs:float(\$t) else ()"/> <sch:report role="warn" test="\$bothnumbers and \$fv gt \$tv"> The numerical range <sch:value-of select="\$f"/>--<sch:value-of select="\$t"/> in <sch:value- of select="name(.)"/> may not be valid. </sch:report> </sch:rule></pre>
Example	The MS. was lost in transmission by mail from < del rend ="overstrike"> <gap atLeast ="1" atMost ="2" extent ="one or two letters" reason ="illegible" unit ="chars"/> Philadelphia to the Graphic office, New York.
Example	Americares has been supporting the health sector in Eastern Europe since 1986, and since 1992 has provided < measure atLeast ="120000000" commodity ="currency" unit ="USD">more than \$120m in aid to Ukrainians.

att.resourced

att.resourced	
provides attributes by which a resource (such as an externally held media file) may be located.	
Module	tei — 0
Members	<graphic>
Attributes	<p>url (uniform resource locator) specifies the URL from which the media concerned may be obtained.</p> <p>Status Required</p> <p>Datatype teidata.pointer</p>

att.segLike

att.segLike	
provides attributes for elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors 17.1. Linguistic Segment Categories]	
Module	tei — 0
Members	<seg>

Attributes	att.datcat (@datcat, @valueDatcat, @targetDatcat) att.fragmentable (@part)
	<p>function (function) characterizes the function of the segment.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Note Attribute values will often vary depending on the type of element to which they are attached. For example, a <cl>, may take values such as coordinate, subject, adverbial etc. For a <phr>, such values as subject, predicate etc. may be more appropriate. Such constraints will typically be implemented by a project-defined customization.</p>

att.sortable

att.sortable	
provides attributes for elements in lists or groups that are sortable, but whose sorting key cannot be derived mechanically from the element content. [9.1. Dictionary Body and Overall Structure]	
Module	tei — 0
Members	<bibl> <biblStruct> <idno> <item> <list> <listBibl> <msDesc> <term>
Attributes	<p>sortKey supplies the sort key for this element in an index, list or group which contains it.</p> <p>Status Optional</p> <p>Datatype teidata.word</p> <div style="border: 1px solid black; padding: 5px;"> <p>David's other principal backer, Josiah ha-Kohen <index indexName="NAMES"> <term sortKey="Azarya_Josiah_Kohen">Josiah ha-Kohen b. Azarya</term> </index> b. Azarya, son of one of the last gaons of Sura was David's own first cousin.</p> </div> <p>Note The sort key is used to determine the sequence and grouping of entries in an index. It provides a sequence of characters which, when sorted with the other values, will produce the desired order; specifics of sort key construction are application-dependent</p> <p>Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under 'fourh', and McCoy may be alphabetized under 'maccoy', while A1, A4, and A5 may all appear in numeric order 'alphabetized' between 'a-' and 'AA'. The sort key is required if the orthography of the dictionary entry does not suffice to determine its location.</p>

att.spanning

att.spanning	
provides attributes for elements which delimit a span of text by pointing mechanisms rather than by enclosing it. [11.3.1.4. Additions and Deletions 1.3.1. Attribute Classes]	
Module	tei — 0
Members	<lb> <pb>
Attributes	spanTo indicates the end of a span initiated by the element bearing this attribute.

	<p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>Schematron The @spanTo attribute must point to an element following the current element</p> <pre><sch:rule context="tei:*[@spanTo]"> <sch:assert test="id(substring(@spanTo,2)) and following::*[@xml:id=substring(current()/@spanTo,2)]">The element indicated by @spanTo (<sch:value-of select="@spanTo"/>) must follow the current element <sch:name/> </sch:assert> </sch:rule></pre>
Note	The span is defined as running in document order from the start of the content of the pointing element to the end of the content of the element pointed to by the @spanTo attribute (if any). If no value is supplied for the attribute, the assumption is that the span is coextensive with the pointing element. If no content is present, the assumption is that the starting point of the span is immediately following the element itself.

att.timed

att.timed	
provides attributes common to those elements which have a duration in time, expressed either absolutely or by reference to an alignment map. [8.3.5. Temporal Information]	
Module	tei — 0
Members	<gap>
Attributes	<p>start indicates the location within a temporal alignment at which this element begins.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>Note If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchic level.</p> <p>end indicates the location within a temporal alignment at which this element ends.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>Note If no value is supplied, the element is assumed to precede the immediately following element at the same hierarchic level.</p>

att.transcriptional

att.transcriptional	
provides attributes specific to elements encoding authorial or scribal intervention in a text when transcribing manuscript or similar sources. [11.3.1.4. Additions and Deletions]	
Module	tei — 0
Members	<add> <subst>
Attributes	<p>att.editLike (@evidence, @instant) att.written (@hand)</p> <p>status indicates the effect of the intervention, for example in the case of a deletion, strikeouts which include too much or too little text, or in the case of an addition, an insertion which duplicates some of the text already present.</p>

	<p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Sample values include:</p> <p>duplicate all of the text indicated as an addition duplicates some text that is in the original, whether the duplication is word-for-word or less exact.</p> <p>duplicate-partial part of the text indicated as an addition duplicates some text that is in the original</p> <p>excessStart some text at the beginning of the deletion is marked as deleted even though it clearly should not be deleted.</p> <p>excessEnd some text at the end of the deletion is marked as deleted even though it clearly should not be deleted.</p> <p>shortStart some text at the beginning of the deletion is not marked as deleted even though it clearly should be.</p> <p>shortEnd some text at the end of the deletion is not marked as deleted even though it clearly should be.</p> <p>partial some text in the deletion is not marked as deleted even though it clearly should be.</p> <p>unremarkable the deletion is not faulty. [Default]</p> <p>Note Status information on each deletion is needed rather rarely except in critical editions from authorial manuscripts; status information on additions is even less common.</p> <p>Marking a deletion or addition as faulty is inescapably an interpretive act; the usual test applied in practice is the linguistic acceptability of the text with and without the letters or words in question.</p> <p>cause documents the presumed cause for the intervention.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>seq (sequence) assigns a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred.</p> <p>Status Optional</p> <p>Datatype teidata.count</p>
--	--

att.typed

att.typed

provides attributes that can be used to classify or subclassify elements in any way. [[1.3.1. Attribute Classes](#) [17.1.1. Words and Above](#) [3.6.1. Referring Strings](#) [3.7. Simple Links and Cross-References](#) [3.6.5. Abbreviations and Their Expansions](#) [3.13.1. Core Tags for Verse](#) [7.2.5. Speech Contents](#) [4.1.1. Un-numbered Divisions](#) [4.1.2. Numbered Divisions](#) [4.2.1. Headings and Trailers](#) [4.4. Virtual Divisions](#) [13.3.2.3. Personal Relationships](#) [11.3.1.1. Core Elements for Transcriptional Work](#) [16.1.1. Elements Unique to Spoken Texts](#) [23.3.1.3. Modification of Attribute and Attribute Value Lists](#)]

Module	tei — 0
Members	<TEI> <abbr> <accMat> <add> <addName> <altIdentifier> <am> <bibl> <biblStruct> <change> <cit> <collection> <corr> <country> <custEvent> <damage> <date> <decoNote> <desc> <dim> <dimensions> <district> <div> <explicit> <figure> <filiation> <finalRubric> <forename> <fw> <geogFeat> <geogName> <graphic> <head> <idno> <incipit> <label> <layout> <lb> <lg> <list> <listBibl> <locus> <material> <measure> <msDesc> <msFrag> <msName> <msPart> <name> <note> <num> <orgName> <origDate> <origPlace> <pb> <persName> <placeName> <provenance> <quote> <ref> <reg> <region> <relatedItem> <rubric> <seal> <seg> <settlement> <signatures> <stamp> <surface> <surfaceGrp> <surname> <term> <text> <title> <zone>
Attributes	<p>type characterizes the element in some sense, using any convenient classification scheme or typology.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <pre><div type="verse"> <head>Night in Tarras</head> <lg type="stanza"> <l>At evening tramping on the hot white road</l> <l>...</l> </lg> <lg type="stanza"> <l>A wind sprang up from nowhere as the sky</l> <l>...</l> </lg> </div></pre> <p>Note The <code>@type</code> attribute is present on a number of elements, not all of which are members of <code>att.type</code>, usually because these elements restrict the possible values for the attribute in a specific way.</p> <p>subtype (subtype) provides a sub-categorization of the element, if needed</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Note The <code>@subtype</code> attribute may be used to provide any sub-classification for the element additional to that provided by its <code>@type</code> attribute.</p>
Schematron	<sch:rule context="tei:*[@subtype]"> <sch:assert test="@type">The <sch:name/> element should not be categorized in detail with <code>@subtype</code> unless also categorized in general with <code>@type</code> </sch:assert> </sch:rule>
Note	When appropriate, values from an established typology should be used. Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the <code><valList></code> element in the project-specific schema description, as described in 23.3.1.3. Modification of Attribute and Attribute Value Lists .

att.written

att.written

provides attributes to indicate the hand in which the content of an element was written in the source being transcribed.

[1.3.1. Attribute Classes]	
Module	tei — 0
Members	att.damaged [<damage>] att.transcriptional [<add> <subst>] <div> <figure> <fw> <head> <hi> <label> <note> <p> <seg> <text> <zone>
Attributes	<p>hand points to a <handNote> element describing the hand considered responsible for the content of the element concerned.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p>

Macros

macro.limitedContent

macro.limitedContent (paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [1.3. The TEI Class System]	
Module	tei — 0
Used by	<desc> <figDesc>
Content model	<pre><content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.limitedPhrase"/> <classRef key="model.inter"/> </alternate> </content></pre>
Declaration	macro.limitedContent = (text model.limitedPhrase model.inter)*

macro.paraContent

macro.paraContent (paragraph content) defines the content of paragraphs and similar elements. [1.3. The TEI Class System]	
Module	tei — 0
Used by	<add> <corr> <damage> <hi> <orig> <p> <ref> <reg> <seg> <sic> <supplied> <title> <unclear>
Content model	<pre><content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.paraPart"/> </alternate> </content></pre>
Declaration	macro.paraContent = (text model.paraPart)*

macro.phraseSeq

macro.phraseSeq (phrase sequence) defines a sequence of character data and phrase-level elements. [1.4.1. Standard Content Models]

Module	tei — 0
Used by	<abbr> <addName> <addrLine> <author> <biblScope> <catchwords> <citedRange> <colophon> <countermark> <country> <distributor> <district> <edition> <editor> <email> <expan> <explicit> <extent> <finalRubric> <foreign> <forename> <fw> <geogFeat> <geogName> <heraldry> <incipit> <label> <material> <measure> <name> <num> <objectType> <orgName> <origPlace> <persName> <placeName> <pubPlace> <publisher> <region> <rubric> <secFol> <settlement> <stamp> <street> <surname> <term> <watermark>
Content model	<content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.gLike"/> <classRef key="model.attributable"/> <classRef key="model.phrase"/> <classRef key="model.global"/> </alternate> </content>
Declaration	macro.phraseSeq = (text model.gLike model.attributable model.phrase model.global)*

macro.phraseSeq.limited

macro.phraseSeq.limited (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [1.4.1. Standard Content Models]

Module	tei — 0
Used by	<authority> <collection> <funder> <institution> <principal> <repository> <resp> <sponsor>
Content model	<content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.limitedPhrase"/> <classRef key="model.global"/> </alternate> </content>
Declaration	macro.phraseSeq.limited = (text model.limitedPhrase model.global)*

macro.specialPara

macro.specialPara ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of

phrase-level and inter-level elements. [1.3. The TEI Class System]	
Module	tei — 0
Used by	<accMat> <acquisition> <additions> <change> <collation> <condition> <custEvent> <decoNote> <filiation> <foliation> <handNote> <item> <layout> <licence> <musicNotation> <note> <origin> <provenance> <q> <quote> <scriptNote> <signatures> <source> <summary> <support> <surrogates> <textLang> <typeNote>
Content model	<pre> <content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.gLike"/> <classRef key="model.phrase"/> <classRef key="model.inter"/> <classRef key="model.divPart"/> <classRef key="model.global"/> </alternate> </content> </pre>
Declaration	<pre> macro.specialPara = (text model.gLike model.phrase model.inter model.divPart model.global)* </pre>

macro.xtext

macro.xtext (extended text) defines a sequence of character data and gaiji elements.	
Module	tei — 0
Used by	<depth> <dim> <ex> <height> <width>
Content model	<pre> <content> <alternate maxOccurs="unbounded" minOccurs="0"> <textNode/> <classRef key="model.gLike"/> </alternate> </content> </pre>
Declaration	<pre> macro.xtext = (text model.gLike)* </pre>

Datatypes

teidata.certainty

teidata.certainty defines the range of attribute values expressing a degree of certainty.	
Module	tei — 0
Used by	teidata.probCert
Content	<content>

model	<pre><valList type="closed"> <valItem ident="high"/> <valItem ident="medium"/> <valItem ident="low"/> <valItem ident="unknown"/> </valList> </content></pre>
Declaration	teidata.certainty = "high" "medium" "low" "unknown"
Note	Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.

teidata.count

teidata.count defines the range of attribute values used for a non-negative integer value used as a count.	
Module	tei — 0
Used by	<p>Element:</p> <ul style="list-style-type: none"> <input type="checkbox"/> <collation>/@mainStructures <input type="checkbox"/> <handDesc>/@hands <input type="checkbox"/> <layout>/@columns <input type="checkbox"/> <layout>/@streams <input type="checkbox"/> <layout>/@ruledLines <input type="checkbox"/> <layout>/@writtenLines <input type="checkbox"/> <zone>/@rotate
Content model	<pre><content> <dataRef name="nonNegativeInteger"/> </content></pre>
Declaration	teidata.count = xsd:nonNegativeInteger
Note	Any positive integer value or zero is permitted

teidata.duration.iso

teidata.duration.iso defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats	
Module	tei — 0
Used by	
Content model	<pre><content> <dataRef name="token" restriction="[0-9.,DHMPRSTWYZ/:+\\-]+"/> </content></pre>
Declaration	teidata.duration.iso = token { pattern = "[0-9.,DHMPRSTWYZ/:+\\-]+" }
Example	<time dur-iso="PT0,75H">three-quarters of an hour</time>

Example	< date dur-iso = "P1,5D" >a day and a half</ date >
Example	< date dur-iso = "P14D" >a fortnight</ date >
Example	< time dur-iso = "PT0.02S" >20 ms</ time >
Note	<p>A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first ‘time’ number-letter pair.</p> <p>For complete details, see ISO 8601 <i>Data elements and interchange formats — Information interchange — Representation of dates and times</i>.</p>

teidata.duration.w3c

teidata.duration.w3c defines the range of attribute values available for representation of a duration in time using W3C datatypes.	
Module	tei — 0
Used by	
Content model	<content> <dataRef name="duration"/> </content>
Declaration	teidata.duration.w3c = xsd:duration
Example	< time dur = "PT45M" >forty-five minutes</ time >
Example	< date dur = "P1DT12H" >a day and a half</ date >
Example	< date dur = "P7D" >a week</ date >
Example	< time dur = "PT0.02S" >20 ms</ time >
Note	<p>A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first ‘time’ number-letter pair.</p> <p>For complete details, see the W3C specification.</p>

teidata.enumerated

teidata.enumerated defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.	
Module	tei — 0
Used by	<p>Element:</p> <ul style="list-style-type: none"> <input type="checkbox"/> <abbr>/@type <input type="checkbox"/> <bibl>/@type <input type="checkbox"/> <decoNote>/@type

	<ul style="list-style-type: none"> <input type="checkbox"/> <desc>/@type <input type="checkbox"/> <dimensions>/@type <input type="checkbox"/> <fw>/@type <input type="checkbox"/> <gap>/@reason <input type="checkbox"/> <gap>/@agent <input type="checkbox"/> <idno>/@type <input type="checkbox"/> <layout>/@rulingMedium <input type="checkbox"/> <list>/@type <input type="checkbox"/> <material>/@function <input type="checkbox"/> <measure>/@type <input type="checkbox"/> <name>/@type <input type="checkbox"/> <num>/@type <input type="checkbox"/> <objectDesc>/@form <input type="checkbox"/> <q>/@type <input type="checkbox"/> <surface>/@attachment <input type="checkbox"/> <title>/@type <input type="checkbox"/> <title>/@level <input type="checkbox"/> <unclear>/@reason <input type="checkbox"/> <unclear>/@agent
Content model	<content> <dataRef key="teidata.word"/> </content>
Declaration	teidata.enumerated = teidata.word
Note	<p>Attributes using this datatype must contain a single ‘word’ which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.</p> <p>Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a <valList> element.</p>

teidata.language

teidata.language defines the range of attribute values used to identify a particular combination of human language and writing system. [\[6.1. Language Identification\]](#)

Module	tei — 0
Used by	<p>Element:</p> <ul style="list-style-type: none"> <input type="checkbox"/> <textLang>/@mainLang <input type="checkbox"/> <textLang>/@otherLangs
Content model	<content> <alternate> <dataRef name="language"/> <valList> <valItem ident="" /> </valList> </alternate>

	</content>
Declaration	teidata.language = xsd:language ("")
Note	<p>The values for this attribute are language ‘tags’ as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.</p> <p>A ‘language tag’, per BCP 47, is assembled from a sequence of components or subtags separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.</p> <p>language The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at http://www.iana.org/assignments/language-subtag-registry. It is recommended that this code be written in lower case.</p> <p>script The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at http://unicode.org/iso15924/iso15924-codes.html. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.</p> <p>region Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at https://www.iso.org/obp/ui/#search/code/. The latter consist of 3 digits; the list of codes can be found at http://unstats.un.org/unsd/methods/m49/m49.htm.</p> <p>variant An IANA-registered variation. These codes ‘are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags’.</p> <p>extension An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.</p> <p>private use An extension that uses the initial subtag of the single letter x (i.e., starts with x-) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI-conformant, a corresponding <language> element must be present in the TEI header.</p> <p>There are two exceptions to the above format. First, there are language tags in the IANA registry that do not</p>

	<p>match the above syntax, but are present because they have been ‘grandfathered’ from previous specifications.</p> <p>Second, an entire language tag can consist of only a private use subtag. These tags start with <code>x-</code>, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding <code><language></code> element in the TEI header.</p> <p>Examples include</p> <p><code>sn Shona</code></p> <p><code>zh-TW Taiwanese</code></p> <p><code>zh-Hant-HK Chinese written in traditional script as used in Hong Kong</code></p> <p><code>en-SL English as spoken in Sierra Leone</code></p> <p><code>pl Polish</code></p> <p><code>es-MX Spanish as spoken in Mexico</code></p> <p><code>es-419 Spanish as spoken in Latin America</code></p> <p>The W3C Internationalization Activity has published a useful introduction to BCP 47, Language tags in HTML and XML.</p>
--	---

teidata.name

teidata.name defines the range of attribute values expressed as an XML Name.	
Module	tei — 0
Used by	<p>Element:</p> <ul style="list-style-type: none"> <input type="checkbox"/> <code><handNote>/@script</code>
Content model	<code><content></code> <code><dataRef name="Name"/></code> <code></content></code>
Declaration	<code>teidata.name = xsd:Name</code>
Note	Attributes using this datatype must contain a single word which follows the rules defining a legal XML name (see https://www.w3.org/TR/REC-xml/#dt-name): for example they cannot include whitespace or begin with digits.

teidata.numeric

teidata.numeric defines the range of attribute values used for numeric values.	
Module	tei — 0

Used by	Element: □ <num>/@value
Content model	<content> <alternate> <dataRef name="double"/> <dataRef name="token" restriction="(-?[\d]+/\-?[\d]+)"/> <dataRef name="decimal"/> </alternate> </content>
Declaration	teidata.numeric = xsd:double token { pattern = "(-?[\d]+/\-?[\d]+)"} xsd:decimal
Note	<p>Any numeric value, represented as a decimal number, in floating point format, or as a ratio.</p> <p>To represent a floating point number, expressed in scientific notation, 'E notation', a variant of 'exponential notation', may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.</p> <p>A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.</p>

teidata.outputMeasurement

teidata.outputMeasurement defines a range of values for use in specifying the size of an object that is intended for display.	
Module	tei — 0
Used by	
Content model	<content> <dataRef name="token" restriction="[-+]?d+(.\d+)?(% cm mm in pt pc px em ex ch rem vw vh vmin vmax)"/> </content>
Declaration	teidata.outputMeasurement = token { pattern = "[-+]?d+(.\d+)?(% cm mm in pt pc px em ex ch rem vw vh vmin vmax)" }
Example	<pre><figure> <head>The TEI Logo</head> <figDesc>Stylized yellow angle brackets with the letters <mentioned>TEI</mentioned> in between and <mentioned>text encoding initiative</mentioned> underneath, all on a white background.</figDesc> <graphic height="600px" url="http://www.tei-c.org/logos/TEI-600.jpg" width="600px"/> </figure></pre>

Note	These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft .
-------------	--

teidata.pattern

teidata.pattern defines attribute values which are expressed as a regular expression.	
Module	tei — 0
Used by	
Content model	<content> <dataRef name="token"/> </content>
Declaration	teidata.pattern = token
Note	A regular expression, often called a pattern, is an expression that describes a set of strings. They are usually used to give a concise description of a set, without having to list all elements. For example, the set containing the three strings <i>Handel</i> , <i>Händel</i> , and <i>Haendel</i> can be described by the pattern H (ä ae ?) ndel (or alternatively, it is said that the pattern H (ä ae ?) ndel matches each of the three strings) Wikipedia
	This TEI datatype is mapped to the XSD token datatype, and may therefore contain any string of characters. However, it is recommended that the value used conform to the particular flavour of regular expression syntax supported by XSD Schema.

teidata.point

teidata.point defines the data type used to express a point in cartesian space.	
Module	tei — 0
Used by	
Content model	<content> <dataRef name="token" restriction="(-?[0-9]+(\.[0-9]+)?,-?[0-9]+(\.[0-9]+)?)"/> </content>
Declaration	teidata.point = token { pattern = "(-?[0-9]+(\.[0-9]+)?,-?[0-9]+(\.[0-9]+)?)"}
Example	<facsimile> <surface lrx="400" lry="280" ulx="0" uly="0"> <zone points="220,100 300,210 170,250 123,234"> <graphic url="handwriting.png"/> </zone> </surface> </facsimile>

Note	A point is defined by two numeric values, which should be expressed as decimal numbers. Neither number can end in a decimal point. E.g., both 0.0,84.2 and 0,84 are allowed, but 0.,84. is not.
-------------	---

teidata.pointer

teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.	
Module	tei — 0
Used by	<p>Element:</p> <ul style="list-style-type: none"> <input type="checkbox"/> <change>/@target <input type="checkbox"/> <include>/@href <input type="checkbox"/> <keywords>/@scheme <input type="checkbox"/> <locus>/@scheme <input type="checkbox"/> <locusGrp>/@scheme <input type="checkbox"/> <material>/@target <input type="checkbox"/> <relatedItem>/@target
Content model	<content> <dataRef name="anyURI" restriction="\\$+\"/> </content>
Declaration	teidata.pointer = xsd:anyURI { pattern = "\\$+" }
Note	<p>The range of syntactically valid values is defined by RFC 3986 Uniform Resource Identifier (URI): Generic Syntax. Note that the values themselves are encoded using RFC 3987 Internationalized Resource Identifiers (IRIs) mapping to URIs. For example, https://secure.wikimedia.org/wikipedia/en/wiki/% is encoded as https://secure.wikimedia.org/wikipedia/en/wiki/%25 while http://موقع.وزارة-الاتصالات.مصر/ is encoded as http://xn--4gbrim.xn----rmckbbajlc6dj7bxne2c.xn--wgbh1c/</p>

teidata.probCert

teidata.probCert defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.	
Module	tei — 0
Used by	
Content model	<content> <alternate> <dataRef key="teidata.probability"/> <dataRef key="teidata.certainty"/> </alternate> </content>
Declaration	teidata.probCert = teidata.probability teidata.certainty

teidata.probability

teidata.probability defines the range of attribute values expressing a probability.	
Module	tei — 0
Used by	teidata.probCert
Content model	<pre><content> <dataRef name="double"/> </content></pre>
Declaration	teidata.probability = xsd:double
Note	Probability is expressed as a real number between 0 and 1; 0 representing <i>certainly false</i> and 1 representing <i>certainly true</i> .

teidata.replacement

teidata.replacement defines attribute values which contain a replacement template.	
Module	tei — 0
Used by	
Content model	<pre><content> <textNode/> </content></pre>
Declaration	teidata.replacement = text

teidata.temporal.iso

teidata.temporal.iso defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the international standard <i>Data elements and interchange formats – Information interchange – Representation of dates and times</i> .	
Module	tei — 0
Used by	
Content model	<pre><content> <alternate> <dataRef name="date"/> <dataRef name="gYear"/> <dataRef name="gMonth"/> <dataRef name="gDay"/> <dataRef name="gYearMonth"/> <dataRef name="gMonthDay"/> <dataRef name="time"/> <dataRef name="dateTime"/> <dataRef name="token" restriction="[0-9.,DHMPRSTWYZ:/+\-]+"/> </alternate> </content></pre>

Declaration	<pre>teidata.temporal.iso = xsd:date xsd:gYear xsd:gMonth xsd:gDay xsd:gYearMonth xsd:gMonthDay xsd:time xsd:dateTime token { pattern = "[0-9.,DHMPRSTWYZ/:+\\-]+\" }</pre>
Note	<p>If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.</p> <p>For all representations for which ISO 8601:2004 describes both a basic and an extended format, these Guidelines recommend use of the extended format.</p>

teidata.temporal.w3c

teidata.temporal.w3c defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C [XML Schema Part 2: Datatypes Second Edition](#) specification.

Module	tei — 0
Used by	
Content model	<pre><content> <alternate> <dataRef name="date"/> <dataRef name="gYear"/> <dataRef name="gMonth"/> <dataRef name="gDay"/> <dataRef name="gYearMonth"/> <dataRef name="gMonthDay"/> <dataRef name="time"/> <dataRef name="dateTime"/> </alternate> </content></pre>
Declaration	<pre>teidata.temporal.w3c = xsd:date xsd:gYear xsd:gMonth xsd:gDay xsd:gYearMonth xsd:gMonthDay xsd:time xsd:dateTime</pre>
Note	<p>If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.</p>

teidata.text

teidata.text defines the range of attribute values used to express some kind of identifying string as a single sequence of Unicode characters possibly including whitespace.	
Module	tei — 0
Used by	Element: <ul style="list-style-type: none"> <input type="checkbox"/> <include>/@xpointer <input type="checkbox"/> <include>/@encoding <input type="checkbox"/> <include>/@accept <input type="checkbox"/> <include>/@accept-charset <input type="checkbox"/> <include>/@accept-language
Content model	<content> <dataRef name="string"/> </content>
Declaration	teidata.text = string
Note	Attributes using this datatype must contain a single ‘token’ in which whitespace and other punctuation characters are permitted.

teidata.truthValue

teidata.truthValue defines the range of attribute values used to express a truth value.	
Module	tei — 0
Used by	Element: <ul style="list-style-type: none"> <input type="checkbox"/> <surface>/@flipping
Content model	<content> <dataRef name="boolean"/> </content>
Declaration	teidata.truthValue = xsd:boolean
Note	The possible values of this datatype are 1 or true, or 0 or false. This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: teidata.xTruthValue.

teidata.version

teidata.version defines the range of attribute values which may be used to specify a TEI or Unicode version number.	
Module	tei — 0
Used by	Element: <ul style="list-style-type: none"> <input type="checkbox"/> <TEI>/@version
Content model	<content>

	<pre><dataRef name="token" restriction="[\d]+(\.[\d]+){0,2}"/> </content></pre>
Declaration	teidata.version = token { pattern = "[\d]+(\.[\d]+){0,2}" }
Note	The value of this attribute follows the pattern specified by the Unicode consortium for its version number (http://unicode.org/versions/). A version number contains digits and fullstop characters only. The first number supplied identifies the major version number. A second and third number, for minor and sub-minor version numbers, may also be supplied.

teidata.versionNumber

teidata.versionNumber defines the range of attribute values used for version numbers.	
Module	tei — 0
Used by	
Content model	<pre><content> <dataRef name="token" restriction="[\d]+[a-z]*[\d]*(\.[\d]+[a-z]*[\d]*){0,3}"/> </content></pre>
Declaration	<pre>teidata.versionNumber = token { pattern = "[\d]+[a-z]*[\d]*(\.[\d]+[a-z]*[\d]*){0,3}" }</pre>

teidata.word

teidata.word defines the range of attribute values expressed as a single word or token.	
Module	tei — 0
Used by	<p>teidata.enumeratedElement:</p> <ul style="list-style-type: none"> <input type="checkbox"/> <availability>/@status <input type="checkbox"/> <handNote>/@execution <input type="checkbox"/> <locus>/@from <input type="checkbox"/> <locus>/@to <input type="checkbox"/> <supplied>/@reason <input type="checkbox"/> <supportDesc>/@material
Content model	<pre><content> <dataRef name="token" restriction="[^p{C}\p{Z}]+"/> </content></pre>
Declaration	teidata.word = token { pattern = "[^p{C}\p{Z}]+" }
Note	Attributes using this datatype must contain a single ‘word’ which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

teidata.xTruthValue

teidata.xTruthValue (extended truth value) defines the range of attribute values used to express a truth value which may be unknown.	
Module	tei — 0
Used by	Element: <ul style="list-style-type: none"> <input type="checkbox"/> <binding>/@contemporary <input type="checkbox"/> <seal>/@contemporary
Content model	<content> <alternate> <dataRef name="boolean"/> <valList> <valItem ident="unknown"/> <valItem ident="inapplicable"/> </valList> </alternate> </content>
Declaration	teidata.xTruthValue = xsd:boolean ("unknown" "inapplicable")
Note	In cases where uncertainty is inappropriate, use the datatype teidata.TruthValue.

teidata.xpath

teidata.xpath defines attribute values which contain an XPath expression.	
Module	tei — 0
Used by	
Content model	<content> <textNode/> </content>
Declaration	teidata.xpath = text
Note	Any XPath expression using the syntax defined in 6.2. . When writing programs that evaluate XPath expressions, programmers should be mindful of the possibility of malicious code injection attacks. For further information about XPath injection attacks, see the article at OWASP .
